On the Nature of the Deposits of the Metals and their
Ores, and the General Principles on which Mining is conducted.

## roo. .lt

Intermediate between the regular and irregular deposits of the metalliferous ores are those forms of occurrence designated by the German word "Fablband." These are more strikingly exhibited in Norway than elsewhere, although the game character has been recognized in other regions on a less extensive scale; and being in some respects peculiar, this mode of occurrence should not be overlooked in a review of the forms of metalliferous deposits.

The Fablbands (German, Fahlband; plural, Fahlbænder), as developed in the district of the Kongsberg silver mines, consis\& of parallel belts of rock of very considerable length and breadth, which are impregnated with the sulphurets of iron, copper and zinc, together with a little lead and silver, divseminated through the rocks in such fine particles as to be hardly visible, and only to be recognized by their tendency to decompose, and thus to give the rock in which they are
contained a peculiar rotten and disintegrated appearance at the surface; hence the name fahlband, or rotten belt, the word fahl being a corruption of faul, the miners' term for a rotten or decomposed rock.

In general, these ore-bearing belts are irregular in thei dimensions, although constantly observing a certain degree of parallelism with each other. They may be traced in the Kongsberg silver-mining district for several miles, and the greatest depth of any is about a thousand feet. The quantity of ore contained in them is usually too small to be worth working ; but oceasionally it is sufficiently concentrated to become the object of mining enterprise. There are seven o
these fahlbands in the vicinity of Kongsberg, and they are parallel in strike and inclination with the gneissoid and schistose strata in which they occur, and have the same local character in relation to dissurbances of stratification, schistose structure, and other external forms.

The fahlbands, however, are themselves traversed by fissure veins bearing argentiferous ores, and the results of extensive mining have shown that these veins are only productive when they intersect the fahlbands, demonstrating that the impregnation of the lode with miveral matter was evi-
dently dependent on the nature of the adjacent rock, and dently dependent on the nature of the adjacent rock, and
furnishing sufficient evidence that the metalliferous particles in the veins were originally derived from the fahlbands, and probably concentrated there by electro-chemical action.
This mode of occurrence will be recognized as peculiar in its character, being a combination of two distinct forms of
meta'liferous deposits; but the fahlbands themselves could meta liferous deposits; but the fahlbands themselves could their enriching action on the lodes which traverse them.
The same fact is observed with regard to the enriching of
fissure veins, when they traverse different beds of rock,
in cases where no perceptible metalliferous particles can be from the filling of fissures by incrustation of the sides with observed in any of them, and when the fahlband structure calcareous matter deposited from aqueous solution, in the may be supposed to be wholly absent. In such cases it is manner of stalactites so common in caverns. not unreasonable to suppose that a chemical examilation of these beds, in which a lode shows itself to be better filled with ore than elsewhere, might reveal the existence of inetal liferous paricles, the presence of which had been previousl unsuspected, because they were too finely disseminated through the rock, or were not of a nature to be easily decomposed, and so failed to give a marked external to the stratum in which they occurred. The fahlbands may be considered as approaching nearest to the class of segregated veins, which comes next in the class of metalliferous deposits given above, and to these, in connection with the other modes of occurrence to which the term "vein" is applied, we now turn our attention
Reqular Deposits-Segregated Veins, Gash Veins, Fisforms of -The line of demarcation between the three drawn, alth ugh in mmst cases tho difference is very apparent, and in all is of great importance in judging of the value of a metalliferous deposit. B at in sanio instancos thare is
so gradual a passage from one form to the other, that surface examinations are not sufficient to enable one to decide the question of the actual existence of a fissure or true vein, and it is only by the indication obtained at some depth be low the surface, that the vein can be placed in its proper class.
By a vein, as a geological and mining term, in general is understood an aggregation of mineral matter of indefinite length and breadth, and comparatively small thickness, difering in character from, and posterior in formation to, the cks which enclose it.
Werner, the great Saxon geologist, defined reins as "mineral repositories of a flat or tabular shape, which traverse the strata without regard to stratification, having the appearance of rents or fissures formed in the rocks, and afterwards filled up with mineral matt $r$ differing more or less from the rocks themselves." This definition would exclude many veins which do not traverse, but run parallel with the
strata, and others which occur in unstratified rocks. The definition given above, of course, includes veins of mineral matter not metalliferous, which are of frequent occurrence, but of no importance in the present connection.
Weissenbach, in a paper published in Cotta's "Contributions to the Knowledge of Mineral Veins," which is espe cially devoted to the subject of the metalliferous lodes of Saxony, has given a general classification of all the modes of occurrence which can be bro
He divides them as follows:

Veins of Sedimentary Origin.-Where a fissure has been filled from above by deposition of mineral matter, in a manner similar to that in which the sedimentary rocks themselves have been formed. The origin of these is exceedingly
imple, siace it is evident that in the process of deposition imple, since it is evident that in the process of deposition of any of the stratified masses, as of sandstone or limestone for instance, if this operation were going on in a region where open fissures existed in the subjacent rock, they would be filled by the sedimentary matter, which would assume a stratified appearance in the fissure exactly as above it. The matter thus deposited would not properly be a metalliferous ore, since this class of products have a chemical not a mechanical origin. This is perfectly evident, and it cannot fail to strike one with surprise that a theory so inconsistent with facts should have been adopted by Werner to account for veins of sedimentary origin is of little importance

Veins of attrition.-Fissures filled with matter intro duced by purely mechanical means, such as by fragments of the wall rock falling from above, or produced by friction of their sides against each ather. These phenomena are exhibited in many ore-bearing veins, in the formation of which two-fold action was concerned
3. Veins of infilration, or stalactitic veins.-These resul
4. Pluionic Veins.-Fissures flled with mineral matter, identical with that of rock formations, or mountain masses and supposed to have been introduced by injection, or pressure from beneath upwards, while in a plastic state. Such are the common gtanite veins in granite or slate.

## Segregated Veins.

## Metalliferous Veins, proper.

These two latter classes are included in the class of reguar, unstratified mineral deposits, as previously shown in the table of mineral formations; the latter division including both gash and fissure veins; and they are the only ones which are of importance in the consideration of the metal-
Segregated Veins.-Under this class of metalliferous deposits are included those vein-like masses which have a crystalline structure, or, at least, a gangue differing from the adjacent mass, but which do not seem to occupy a previously existing fissure in the rock, being so enveloped and limited on all sides within it, as to show that the metalliferous and mineral substances of which they are made up could not have been introduced into their present position in any other way than by a gradual elimination of their component particles from the surrounding formation. Their process seems to have been of a chemical nature, and one by which materials of similar character were collected together from all directions, or segregated, as it is termed. Of the conditions under which the adjacent rocks must have been when such an elimination of their metallic contents took place, we know little with certainty. We see, however, examples of segregation in masses of lava, as they cool from a state of igneous fluidity, when crystals of the different mineral species found in such rocks are found to have crystallized out into distinct individuals, from what was before an apparently homogeneous paste. The same is true of granite and the trappean racks. In the former, the single crystals sometimes attain the length of several feet. If circumstances cause the aegregating crystals to imitate an elongated mass, we have at once the rudimentary form of a vein-like mass, which may continue to develop itself and acquire considerable dimensions. A tendency to this separation of pure quartzose material will be noticed in almost all of the so-called metamorphic rocks, which frequently show bands of pure quariz, parallel with each other, and lying in the plane of stratification of the enclosing rock ; and it should be noticed that quartz is almost universally the veinstone of ores accurring in this orm of deposit.
These segregated veins differ from true veins in some important respects. In the first place, they lie parallel with the

Fig. 3.
 cleavage planes of the formation in which they occur, which is the gneissic and schistose portion of the metamorphic palæozoic rocks. The annexed wood-cut (ig. 3) represents an deal section of the form of deposit here under consideration. The ore-bearing mass may or may not appear at the surface, but its extent downwards in one plane is not to be relied upon as in case of a fissure vein, since the accumulation is liable, at any point, to be found thinning out in depth, and transferred to another plane as represented in the figure.

A striking illustration of this form of deposit may be seen in the Rammelsberg, one of the most celebrated localities of
 4). The principal mass
of ore ( $a, c$, lies in the
direction of the argillaceous slates of which the mountain is made up.
At the depth of about 400 feet, it sends off a branch (b), which dips at a considerably less angle than the slates themselves. The great-
est thickness of the mass of ore is over 150 feet; and its length is about 1900 ; bat the dimensions decrease in depth, and at 800 feet its thickness is about 20 , and its length 750 feet ; so that there can be little doubt that the mass will terminate entirely at a certain not very great depth. The ores of this singular mass are chiefly sulphurets of iron, zinc, lead and copper, intimately blended together, and almost entirely destitute of gangue.

The auriferous quartz veins of most gold regions belong to this class of deposits. They consist of belts of quartzose matter with sulphuret of iron, which near the surface is decomposed into a hydrated oxide, and contain gold disseminated through these substances, and sometimes in the ad These belts run with the strata and dip with them, and in other respects exhibit the phenomena of segregated rather than of fissure reins.
Practically, the most important feature of this class of deposits is that they cannot be depended on in depth as true veins ; as they seem almost always to be richest near the surface, and frequently terminate altogether at no very considerable depth. Nor is the ore or metal matter distributed through them with as much regularity as in the true veins, forming of en a series of nests and pockets ranged in a general lipear direction, and counected by mere threads of ore or barren veinstone.

Krupp's Cast Steel Tyres.-Two of these tyres have been loaned to Mr. Krupp by the North London Railway Company, and are placed in the Exhibition, with his magnificent show of 100 tons of cast-steel cannon, axles, tyres, crank, intermediate and other shafts, together of the value of $\$ 90,000$.
The tyres above referred to have run sixty-seven thousand miles, and do not yet require turning. The road is very severe upon tyres, and the engines are of the heaviest class, and continually mider the brako, tho stoppagoe averagnug about every mile.
Here is an extract from a report made to the Board of Directors by their engineer, dated April 14, 1862: "The engines of this line run one million miles per annum, in round numbers, and this mileage performed by Krupp's tyres would cost $£ 7336 \mathrm{~s}$. 8 ., while by the Low Moor tyres the cost would be $£ 2,08710$ s.
The average thickness of the tyres is 2.21 inches, and Krupp's are calculated to be worn down to one inch before they are disearded. To rnn 189,539 miles will require one set of Krupp's tyres, four times tarned, at a cost of $£ 139$, or six sets of Low Moor, twelve times turned, at a cost of $£ 396$, without making any allowance for the value of the old me-tal-which is greatly in faror of Krupp's. The cost, therefore of running one thousand miles is 14 s . 8d. by Krupp's and $£ 2$ Is. 9 d. by Low Moor tyres, showing a saving of 65 per cent.
It is a remarkable fact that the Belgian steel is even in-
ferior to iron, showing cleatly that the quality of Krupp's steel, and not the mere fact of his tyres being steel at all, i the important consideration. - American Railuthy Revier.

## GIRD'S BUDDING KNIFE.

The accompanying illustration, executed at this office, represents Mr. E. D. Gird's Budding Knife, a most invaluable invention for the Pacific States. Mr. J. Silversmith, of San Francisco, has been authorized to dispose of the right for States, Territories and counties for the Pacific Coast only.
This invention is one of the many California has thus far produced, and is certainly deserving of her, it being the most useful and practicable for the purposes designed. The horticulturist who once adopts this knife will find its value so evident that ever after its services will be indispensable, since with it much labor and expense are saved. In speaking of it the Scientific American says:
"The above engraving illustrates a knife which is calculated to facilitate materially the process of budding. Upon
the ends of the blades are formed crescent-shaped crosses of steel with fine edges for cutting the T•shaped sl t in the bark of the tree to be budded. These blades with their crosses are made of different sizes, so that some one of the three may be adapted to the size of the tree to be operated upon.

It is the practice of some horticultarists to remove the bit of wood which is cut from the scion with the bud, and to insert the bark only with the bud. To save this operation, the round blade is formed with several curves in its edge, so that it will cut the bark alone from the scion without taking off the bit of wood, the curves being of different radii to adapt them to scions of different sizes.

With this knife several operations are reduced to one, and the process of budding is greatly facilitated. The cres-cent-shaped cross is pressed through the bark making the transverse cut, and then by simply carrying the knife down, the vertical slit is made, and the bark is raised at the same time ready to receive the bud. This knife was used in California during the last season, for budding several thousand trees, and it gave great satisfaction to the operators."
Those desiring to purchase will please address Julius Silversmith, San Francisco, respecting terms, \&c.

## OORNS AND BUNIONS REMOVED.

DR. BYRON C. KENNEDY, practical Cemropodist, Iste of Philadelphin, would most respectfully inform the citizens of San Francisco that he has opened his office at No. 12 Montgomery street, opposite the Lick House, where he is prepared to remove all excresences, such has Corns, Buaions, Inverted Nails, Enlarged Joints, Swelled Insteps, Frosted Feet, Chilblains, Callosities, and all diseases of the Feet, without pain or inconvenience to the patient.
Dr. Kennedy also attends to Ganglion, or Scorbutic U1cers, and all other diseases of the Skin. He may be consulted at his oflice, No. 12 Montgomery street, opposite the Lick House, from 9 to 12 A . s., and 2 to 6 P. ar. Having devoted six years of study to this important, bat too much neglected, brunch of human knowledge, and having studied anatomy ander the mostskiiful and scientific Professors of Philadelphia, and having made this branch of surgical science my speciality for nine years, enables ué to operate skilfolly and successfully. In England, France and Austria the highest prizes are often awarded to practitioners in this branch of surgical science, and it occupies with others an equally lofty positiou in the profession.
Voizin is au illastrious example, a shining light, among the philosophical stars of Europe, and Dr. Byron C. Kennedy has fally equaled him in this country, as a proof of which the Faculty of the University College of Philadelphia, Pa., complimented him with testimenials.
Dr. Kennedy has bent his earnest attention to the cure of these diseases, in which he has become so great an expert that he is now regarded as the leader in this conntry, in this brauch of the profession, thronghout the United States.

The following letter. which emphatically speaks tor itself, was written by Dr. W. L. Stevens of the University College of Philadelphia:

 delphia and also the peoplo of the State of California the esteem io which
we hold you, sand knowlag that nothang is more essential to your success
than the encouragement which your may recerve from the people of PhilaWe hold yon, and knowligg that nothang is more essential to your success
than thoencouragemont which you may recerve from the people of Phila-
delphia, in the middst of which is the playground of your boyhood, and delphia, in the mldst of which is the playground of your boyhood, and
knowing that you have devoted yoars of stedy to this important bat too
much neglected branch of humati knowledge; that you have atniued to the Much neglected brasch of human knowledge; that you have sttaiued to the
highest rank in your profession, soreral of tie Faculty and other prominent
citizens of Plaladelphia citizens of Philadelphia having submitted to yoar manipulation, wo cin re-
commond you with conflence to the citizens of San Francisco, as, olse of the commend you with confldenee to the citizens of San Francisoo, 29 olte of the
nasat skifful surgeons of the age, and wo hopo your success may be such as

## THE EYES! THE EYES!! THE EYES!!!

DR. E. H. PARDEE,
Oculist and Aurist to the San Froncisco Deaf, Dumb and Blind Asylum.

After a protracted blindness of more than five years, Dr PARDFE has made himself thoroughly and scientifically acquainted with all diseases of the Eye, and is now practicing with a success that cannot be surpassed in the United States; and as proof of this he substantiates by many cases now in California that have been cured by him, after having exhausted the skill of the eminent physicians and oculists of New York city, Boston and Philadelphia.
From an extensive practical knowledge of more than 14 years, Dr. Pardee asserts, and is prepared to prove, that there has been more blindness from bad and improper treatment than from disease itself-how can it be otherwise when we take into consideration the effects of the old hacknied course of local treatment that patients undergo-Caustic to-day and Bluestone to-morrow-more painful than death, and always more tedious than the disease. Patients are daily presenting themselves with chronic cases, and on inquiring what had beeu formerly done, the almost invariable reply is, "I had my eyes burned with caustic or bluestone;" I was bled and blistered, then cupped two or three times a week-had a blue pill preseribed for me at night, and salts in the morning-was ordered in a dark room-to keep my eyes tightly bandaged - to avoid the open air and exercise," with fifty other inconsistencies, the aggregate of which is sure blindness. Patients should be careful and not place their eyes at the mercies of a man who does nothing but bura them daily, not investigating the circumstances of each particular case, but ignorantly and blindly adopting aud following theories the most erroneous, and destructive to the eye. How much more rational and consistent to consult an experienced Oculist, who thoroughly understands every dis ease of this tender organ in all its aspects and varieties. Dr PARDEE has from sixty to one hundred patients uuder his daily supervision, and, with but very ferr cases, they have al been treated by other physicians hefore applying to him-and all to no benefit. Those woo are doubtful are permitted to call at Dr. Pardee's office and confer with the many patients who convene there between the hours of 9 and 12 in the forenoon. The Dr. has a large and only assortment of Artificial Eyes on this coast, inserted, having all the movements of the real eye, and that they lonk so life-like that no one can tell them, when properly inserted, from the real eye. These eyes are sold reasonable

## Regarding Patents.

We desire to call the aittention of all those who intend applying for Patents, to our superior facilities for obtaining the same. Our arrangements are such that we can have all the papers prepared,transmitted and returned, with the Patent Right, in three months from the time the applicant places the matter into our hands; thus saving at least three months delay.
The expense to the applicant would be rather less, if the business be done by us, than if the papers were sent to New York or Washington.
Thus by patronizing a home institution, our inventive citizens can save both time and money.
We have prompt, intelligent and reliable agents in the city of Washington who attend punctually to all Patent business sent to them. We have agents, also, at London, Paris, Brussels, Hamburg, St. Petersburg, Berlin, Vienna, and other European capitals.
195 We have also now associated with usin our business Wr. H. R. Wood, Esq., whose well known legal acquirements, and practical care, punctuality and correctness, eminently qualify him for business of this kind. Dr. Wood also acts as general agent for all persons having business to be attended to either in this city or Washington city.

## Agriculture in the Mines.

The metalliferous districts of California are so extensive, extending as they do from the Rocky Mountains on the east to the Coast Range on the west, and including both ranges of mountains, that the encouragement of the cultivation of the earth in different localities throughout this vast region could not fail to be of great utility and convenience. If all the more important necessaries of life were raised at his immediate door, or in his vicinage, it would certainly acorue much to the advantage of the miner. Hence the cultivation of the valleys and mountain gorges throughout the mines should be countenanced and encouraged. Hence, also, by a law of our State a certain protection is thrown around agriculture in the mining districts. But that protection is so indefinite and restricted, and has been so hampered and "whit. tled down" by the decisions of the courts, that it amounts to but little, if any, encouragement.

So great are the benefits which would attend on such varied avocations, whereby the money with which to buy and the thing to be bought, would be produced in the same locality, and thus the freightage, and drayage and transportation from distant points be obviated, that it would be worth the while of the mining population to take this matter in hand themselves, and adopt rules and regulations on the subject. They are authorized to enact laws for their own government in their different mining districts. Why not, then, adopt some rules by which a farmer raising breadstuffis and meats for your nse, in your neighburhood, may be properly and amply protected in the enjoyment of the fruits of his labor ?

As the law now stands, any land which is found to contain minerals, ne matter in how small proportion, lying in the mining region, may be appropriated by the miner, notwithstanding it may have been previously appropriated for agricaltural purposes. But, would it not be a good rule to make the miner's right of ousting the farmer depend on the existence of a certaiu proportionate quantity of mineral in the soil? That proportion might be fixed at the minimum paying quantity; and whenever the ground ceased to contain a sufficient quantity of the precious metals to warrant its being profitably worked, then let it be subject to the claim of the cultivator. Perbaps all the soil in the mining districts cuntains more or less of mineral properties and substances and it is certainly unreasonable and impolitic to say that because a piece of land may contain a few grains of gold per acre, that, therefore, it cannot be appropriated for agricultural purposes. Hence some standard and rule ought to be fixed by the regulations of the miners, and by State legislation, which will afforãa a sure test and criterion by which the conflicting claims of miners and farmers may be adjusted, relative to such lands as are situated within the miuing regions of the State.

## The Coso Mining District.

A few details respecting this immensely rich mining district may not be inappropriate at this juncture. Of late many rich leads have been discovered and opened, yielding results scarcely to be anticipated. A few months since we published an illustration exhibiting the leading mining localities, with particulars relating thereto. Since then, considerable work and muning enterprises of great moment have been performed, which certainly places mining interests in that district at handsome figures, and the present mine owners promise themselves as rich a harvest as some of the great Washoe adventurers. We will give a short synopsis of the companies now fully under way for developing these mines. The Pioneer Mill, erected by Mr. G. H. Monroe of San Francisco, was the first crushing apparatus, and is situated at Willow Springs, 5 miles east of the Coso Company's lead; it is a dry crushing mill, propelled by steam, and is capable of crushing about six tons of quartz por diem. Mr. Monroe contemplates soon èrecting an 8 -stamp mill, which will cgntain the latest improvod steam pans. To this mill belongs three distinct leads, entitled respectively the Winoshick, War-Tab and Decorah, comprising 900 feet each. From tests made of the ore it is found to contain about 60 per ct. gold and about 40 per cent. silver.
The Coso Silver Mining Company have seven leads, which have been described in a former edition. Altogether there are now six mills in working condition, and more are on their way to that country. Some four companies are now incorporated, all of which are prospecting their claims diligently. Thus district presents some of the most important advantages when compared with other mining localities. Plenty of wood, water, and easy access to the leads by means of good roads, are some of its leading features. The climate is as salubrious as that of Italy, and there is nothing to prevent the miner from prosecating his work the whole year.
Sorentific Tour.-The senior editor of this paper started on the 9th inst. for his lecturing tour through the mining regions of this coast. He sets ont well equipped for the expedition, being amply provided with all manner of diagrams and drawings necessary to the elucidation of his subject. Our mining population will, doubtless, receive a great and useful accession to their stociz of valuable information relative to the best manner of working and developing the riches of our mineral localities. We bespeak for him an attentive hearing and a liberal patronage.
Meteoric Shower-A correspondent of the Red Bluff Beacon writes that just before daylight on the 10th ult., he observed a remarkable appearance in the heavens, as of dopping or falling stars in every directiou from zenith to hori
zon. These luminous glokes or globoles were apparently of zon. These luminous globes or globules were apparently of different sizes, from a common marble to that of a hen's egg, and came gently down, some quite near the ground, then burst and vanished. He awakened sereral member of his tamily, then went to arouse a friend but found him intently watching the same phenomenon. They all gazed and woninvisible. The appearance was similar to the meteoric shower of the 1 st of Novemher, 1833, which was observed
throughout the Northern States.

Modern Sewing Machines.

As a household god, the sewing machine ranks equal and is as necessary as the utensils for preparing our daily nourishment. The combined efforts of science and mechanics have made many improvements, and reduced this machine to such simplicity and cheapness as to bring it within the reach of the poorest housekceper. From Patent Reports we learn that nearly one hundfed patents have been obtained since the original invention, a period of twelve years. As an article in manufacturing, it has proved one of the greatest auxiliaries, and its influence on commerce has been materially felt in every civilized conntry. We preseut in this 1ssue an illustration of the New England. Family Sewing Machine, of which the above cut is a faithful representation. It ranks probably as the neatest, simplest and perhaps cheapest sewing machine now in use. An agency has been establisled in this city, and since their introduction the sale has been so great that the factory had to enlarge its facilities to enable them to fill the orders coming from the Pacific States. Messrs. Stewart \& Shear, at No. 60 Secoud street, in this city, are the general agents, but they have established subagencies throughout this coast. The cost of this machine is ouly $\$ 25$, as will be seen by the advertisement elsewhere.

## Frederik Reichel's Improved Buckle.

The above engraving presents another splendid improvement in ladies' buckles, for which we have prepared an application for letters patent for the inventor, Mr. Reichel, of this city. This invention consists chiefly in the peculiar construction of the plate (c) which has an orifice (d) through which the waistband is introduced, requiring no sewing; the other end of said waistband being then taken around the waist and passed between the cylinders ( $a$ and $b$ ), and when the required tension is obtained, the prongs ( $a, a, a$ ) serve in holding the ribbon securely. This device is by far the simplest, most convenient and most expeditious ornament for ladies yet invented. The inventor is favorably known in this State as a manufacturer of jewelry, \&c. Mr. R. will execute all orders entrusted to him, and give information respecting his invention. Elsewhere read his advertisement.

New Invention.-There is on exhibition at Stockton a new style of windmill of the combination order. It is called "Holmes' Patent," and is so constructed as to be self-regulating, at the same time duplicating the force of the wind and motive power. This is effected by placing the revolving fans in a large drum, which operate dir ctly opposite stationary fans in the drumhead. The governing fans stand perpendicular, and the force of a strong breeze will incline the fan to a literal angle and contract the fanges, which are so prepared and placed as to almost entirely close the opposite end of the drum, thus, on a direct scientific principle, governing the revolution of the wheel.
Bur Cloyer. - In a correspondence with the California Farmer, Gen. Allen mentions abundance of "trebol," or bur clover, growing in Los Angeles county. It affords the best sort of hay, and without the trouble of mowing.

## SUMMARY OF MINING NEWS <br> 

## caldfornia.

## NEVADA TERRITORY.

We gather the following items fron the Enterprige of the 30th Augnst A picimen of excredugly rich quariz has been left at thly offee from the Pride of the West mine, situated at siver City. Bright, yellow gold stickn
out all over th. The cols is uncomanonly coarge for Washoe, and is con-
 of ore just rassed from this point will average $\$ 150$ per tous. They are now
rumaig a tuvael that will strite the lead $3 \nu 0$ feet below the surface. This tunnel startn near Juhnson's mill. There are certainly many more leads in
thas district thas would pay equally as woll as the Prude of tbe Weat wero they as well dryeloped, Sevaral nibers are paying from $\$ 40$ to $\$ 70$ per ton.
Capital in needed in Dovil's Gate district. All the work that has beon done so far has beed done by muers with littlo or no means.
The principal companies in the Flowery district are at work on their leads. Several of chem are gelesing out very tair ore, and a fow rocts sulficiently rioh
to pay for crisling. The mills are all at work, and tholigh thers is not much likelhhond of a large towa being bult in that locality, we have vo yearn only are required to develop the many promising mines found is the
surrounting hils, As the flow of water is increased by tho driving in of
eunnelo at the head of the canon, many fine sites for water mills may be qunnels at the head of the canon,
found in the viciuity of Flowery.
Virgioia City is generally sprending-" coming out of the wilderuess."
Oror ono hundred uew buildings have been erected the past fow mnths, and from present appearauces ous hundred more will be erected the coming A correspmadent
A correspondent writes of this Territory as follows: There is nnt in the Word so many rich mines in the same scope of territory as we have is gold and silver ores, equal to one mill (the Gould \& Curry) now nearly rea-
ay to go into operation in this Territory; and teken altogether, there are no nilis la the worla that will compare farorably for completebess io every
department with the hundred or more malls now in operation in Nevada.
Efsmeralda.-The mines here are juat now exciting considerable intorest, not only among those who are fortunale enough to be saterested in
them, but among the people of the outaide world, who are always watching them, but among the people of the outaide world, who are always watching the iliferent mining iistricts on this side of the Sierras. Although but littie
has beea said about tho mines in this district, yet during the senson considerable in the way of prospecting has been done, and a large amout of labor has been expended upon the diferent ledges within the past three o doubt, that the mines here are tar more exteosive thau those who were a noat intimately aceqainted with the district ever believed them to be. A
mutnber of new discoveries have been made receutly, which bids fair to number of new discoveries have been made receutly, which bids fair
equal. if not excel, anythins ever found in the place. Noledge in the distri has eser produced heter sliecimen, from the top rock than has been found
upon the Isabella, Mary Ellon, Osceol, and Rio Vista, Not even the Bunker anything from the top superior to the specimens found upon thoso above routioned.
There are two companies owning the Bunker Hill lode-one called the Dis-
covery company, the other the First South Extension. Those who discovered the ledge diviled it as near in the center of the croppings as could well be, and thus making two companies. Many persons have serious objections to extensious, for the reason that, in most casus, they are hard to 6 nd: but
in this instance, as in that of tho Winnemucca lode, at Aurora, the extension is just as good as the discovery. The companiy owang the extension have
a shaft down to the depth of 40 feet, and have a shaft down to the depth of 40 feet, and have out about 30 toln of very rich
quariz, which they intend to have snon crushed. The quartz is now mostly
decomposed decomposed, and is very rich in both gold and silver. Some of this quartz and you can cut it in flakes as you would a piece of hard soap, and is as ful of ane gold and silver as it can well be, and called quartz.
The Minnohaha comes next inte notico. The company
have a shaft or incline in about 40 feet. They have taken out some 25 tons of excellent looking quartz, which Fairly sparklen with gold, and showa un-
mistakable iodicitions of beiog very rich in ailver. The ledge is about two mistakable iodicitions of belog very rich in silver. The ledge is aboutt
feat thick and alled with blue silver veins from one side to the other. The two lodes above mentioned have the most work doue upon them they were opeued, would prove as good as the Bunker Hill or Minnehaba,
Some of the mnst prominent veins are the Hegh Peak, North Star, Body Blut, Euraka, Union, and I might mentiou many more, sll of which are well
defiond quartz veins, and skow indications of something worth digging for. beguad quartz veins, and show indications of something worth diggivg for.
The placer claims are paying very well. The boys, as a general thing, bappens. They perhaps average about $\$ 5$ per day. The gold here is worth
but $\$ 12$ au ounce. Twn years ago the merchants gavo $\$ 16$ for it . The causo
of its deprecition is, of course, unknowo. At the anoual meeting held on the 9th August, for the election of Rocordbut no chauge of importance.- [Bodia cor. of Star. The California State Telegraph company bave arranged to telegraph to Aurora, in Esmernlda, by way of Genoa. Dispatches will be sent by the
wires to that point, and then forwarded to Aurora each day. Answers wiil be returned by express and telegraph.
Humboldt.-A correspondent of the Sllver Age writing from Spring Bey, in the Humboldt mines, under date of Aug. 30, , 月殳ye Prospecting is being carried on with mnch energy. Some very rich strikes
have recently beeu made. The Ophir company situgted in this district have recenty been made. The ophir company, situated in this district,
have struck their ledge, which is rich in gold and silver. Tho ledge is aboul four feet thick. The Oneids company, on the same lrad, are running a tunnel, and expect to strike thair lead soon. The Badger company havu struck
a gnod silver lead. The Moonlight is considered one of the beat claims in a gnod silver lead. The Moonlight is considered one of the best cleims in
Humboldt county. Gnods are coming in pretty freely, the large proportiou
of which consisti of liquors. During the past two weoks there has been no

## UREGON AND WASHRNGTON TERRITORY.

Capt. R. Bledsoe who has just arrived from the new mines, writes thus from Florence, under dite of Ang. 14:
1 got back last nught from the new mines, nad after prospecting eix days
I aun sabisfed that they are as guod as the Fiorence mines. Finclo ed find pans if average dirt. From what 1 saw, 1 am of the opiniont that the mine are extensive, an dew creeks aud gulches are to be found every day. They
are on the enst fork of Headow crcek, about 45 miles from Hiornco, ani seariy due east. A great many have gone aernss Salmon, thinking they
were on Payette river, but they are on the right trailnow. Lucas, Morrow \& Co., on the river, at Canon City, took out from thei
claim $\$ 307$. Pay durt nit tho bed rock from 4 to 6 fect thick. On the alter norm of the 11 th, five men furnished dirt from the bed rock for one rocker,
atid tonk out 185 -16 nunces. This was the return for half a day's work. The week previoun they trak out in oue day $\$ 235$.
On Hoch Guteh, Howers, HeDopatd \&Co., workitg threo mon, with sluices.
ook out on Tuesday of last week $\$ 4988$. Their claim averages about $\$ 15$ The Trenton company, six men, on the creck, near Canon City, on the 12th after a hentestripping the day previous, took out $\$ 115$.
Abont 150 men are workiug on Dixie creek, some 15 Aboit 150 men are workiug on Dixie creek, some 15 miles above Canon Civ, on the opposite side or the river They report good prospect. the lack of captal and the scarcity of lumber. Everything goen to show th ichuess of this creek, uod as eoon as it is fiumed and ecicatifically worked A correspondent of the Bountaineer writing from Canon City, John Day mives, under date of August 4 , says.
The minea are turning out first-rate, and next year this will he one of the
best mining camps in the country. One company who are down to the bed rock have got out as high as $\$ 118$ to the pan. Another company of three
men touk out in one day 105 ounces. About 40 tunnels hnve been started and these are paying from $\$ 5$ to 10 ounces per day to the hand. Thero are now bere and within two thiles of this place, vearly ove thousnad mon, and a fonm enough for fo thous, mow this seasoa.
The saine paper, published at the Dallon, gives the following in regard to
the trade and prices of goode at that place: Nhour, $\$ 8 @ \$ 10 ;$ vacou, 16 ceuts; beans, $12 \%$ cts; coffet, 29c; tea, 80c@si $225 ;$ miners' cau at all times be bought at the Dalles at low figures. A fair "pack" can
 The trade ot the Jobo Day mines begins to assume quite an important fea Another party, writing to a faiend from the prospective town of Indepen dence, on one of the triuutaries of John Day's river, says the miners are eu large quanditiee of they are located the "Yeilow Bluff District." It is about $11 / 1$ mile
which long and on an average 400 feet wido. It is opposite to the mouth of Granit
creek. It is about ave fuet to the bed-roek, payiag about four cents to pa cun work it advantageously they must flume the creek. Lumber is wort $\$ 200$ per thousaud, making fluming quite an expensive operation. The gol
is fue, spooth and heavy. The mines are workable avout four months the year. The weather was so cold on the $25 t h$ July as to freezo water i riel in spots.

Ir. Sessions thinks the gold-bearing range is extensive, but onl
The mines on Granite creek were paying well; they extend from the mouth of the creck, up the same, sbout eight miles. Flour is worth in the mine

Jetrelers' Gold. - The London Mechanics' Magazine contains the following interesting remarks on this subject: From very ancigut times it has been the practice to divido the ounce truy into twenty four imaginary puris. An ounce of pure gold, therefore, and what is called iwenty-four carat gold, are identical terms. Anything less than twenty-four carat gold indicates that in an ounce of that substance there are so many tryenty-fourth parts of pure gold, and that the remaining portions of an ounce of it is made ap of an alloy of some inferior metal, usually copper. Except for wedding rings, which are, or should be, made of standard gold, consisting of twenty-two parts or carats of pure gold, and two of copper alloy, jewelers seldom use gold of a higher rate of purity than eighteen-carat. How often they use it of a much lower degree of fineness they know best. There is no doubt that it is possible to give almost any color to gold, by the addition of particular alloys, and of late ingenuity has been at work to give the sixteen-carat gold the appearance of pure gold. Ithis is done by the aid, partly, of what is technically known as the coloring pot, in which the metal is treated to an acid bath of a certain amount of strength. By the judicious use of this contrivance, twenty-two carat gold may be made to resemble very closely native gold, as found in the shape of nuggets in California or Australia. Nuggets re never, however, found to be pure gold-they consist for the most part of 23 or $231 / 2$-carat gold, the fraction being made up of an alloy of some inferior metal. In order to test the purity of gold the application of heat is, perbaps, one of the simplest means. Pure gold will not be in the least discolored by it, while twenty-three-carat gold will take a slightly red tint. There is this disadvantage ubout the mode of testing suggested, it will certainly discolor very materially all gold of degrees of fineness inferior to that of twenty-threecarat, and nothing but the acid bath will restore it to its original hue. In order to effect this latter operation on a small scale, nothing more is necessary than to obtain an earthen pipkin, or gallipot, place the article in it, cover it with nitric acid, and hold it over a spirit or gas lamp, or even a candle, until the acid boils. The result will be that the metal will be restored to its original brightness.
As regards the testing of the genuineness of gold coin, there is nothing equal in simplicity or efficacy to weighing it. It is impossible that any metal juferior to standard gold can be used in the manufacture of counterfeit sovereigus or halfsovereigas which will give pieces, of the same size, of equal veight
'I'he testing of " jewe'ers' gold," when used in the manufacture of many kinds of trinkets, is a matter attended with considerable risk and difficulty, and perhaps the only means readily at the command of the purchaser for ensuring a proper relationship between quality and price in such cases, is to ascertain the respectability of the seller.
[Twenty-four-carat gold means pure gold, independent of its quantity-whether an ounce more or less.-ED.]
Gas.-There is a spouting well in Salineville, Ohio, up which gas rushes in large volumes and with great violence.

WHY WILL YOU SUFFER, YOU THAT ARE AFFLICTED?

DISEASES CURED WITHOUT' THE USE OF MEDICLNES!

THE DIRECTORS OF
The Electropathic Institute, 645 washington street,
Offer those who would avail themselves of the researches into the arena of medical seience, an opportunity to benefit thereby. Thus, by the application of an art totally differng from the usual routine systemis of the day, Electropathy is now the favorite study and practice of the most learned medical savans throughout continental Europe. Every proof exists that the- mignetic electro current reaches directly the nervons centres, the brain, spinal cord and nerves of sensibility and motion, the controlling agents of organic life. The application of this powerfal and mysterious agent is thus made; uoder the guiding hand of experience, subservient to the alleviation of disease, restoring through the mediam of the nervons system the normal functions of the various viscera. By this agent the pernicious consequences of converting that most dehcate of organic tissues, the stomach, into a chemical laboratory or drug shop, is totally avoided. Thorsainds can testify as to its efficacy, and many have experienced its beneficial effects. When correctly administered, Electropathy is applicable to all diseases to which flesh is heir, but more particularly to complaints of the nervous system, Rheumatism, diseases of the Langs and Spine.
The Directors have secured the services of Dr. JOSSELTN, whose improved Electropathic Instrument staods in advance of all others as a curative agent. This scientific Physician will be in attendance from 9 A . M. until 8 P . Mr., to consalt with the afficted, and in all cases where he can conscientiously do so he will warrant a perfect and permanent cure. Those particularly who have exhausted the catalogue of medicines, will do well to call and consult him, and ezamine the certificates of cure which he has recorded in the Institute.

## Rheumatism: Rheumatism:

The above troublesome disease can be cured by electricity only; and Dr. Joselyn of the Electropathic Institute will warrait a cure, perfect and permanent, in a very short time, or ask no pay for his services.

## Consumption,

That awful and hitherto considered incurable disease, can be cured by the Electro-Magoetic treatment. The Electropathic treatment at once stops the ravages of this fell destroyer, and the cure commeuces from the first treatment. A cure in all cases will be insured.

## Diseases of the Eye.

The Electric treationt is the only mode by which a rapid and permanent cure can be effected in Sore Eyes. It acts upon the nerves and mucous membrane connected with the eye, and the removal of morbid matter and all inflammation, produces a healthy action, at once restoring that va'uable organ to its natural state. A cure warrahted, or no pay asked.

## Electro-Nagnetic Baths.

Connected with this system are the renowned ElectroMagnetic Baths. Here let us caution the public against the numerous impositions in the bathiag line. The pure magnetic bath is one of the most effective aids in the removal of disease from the system, but if given at the wrong time is likely to aggravate trouble; and cases have been known where the patient has been injured so badly as to require months to remove the injury. The only place where these baths can be obtained in all their purity is at the Institnte, where the resident physician will be always ready to examine and see that they are not unseasonably administered, and if not necessary, advise the requisite remedy.
Below will be found a list of the cases which have been successfuly treated by the Electropathic System, at the Intitute, during the last year :

## Our Mint, its Rules, Charges and Operations.

In the columns of a contemporary we observe some exceedngly interesting statistics of mint matters for many years past, from which we glean the facts that the legal limit of wastage was $\$ 207,76699$ fer the three years ending April, 1857 , while the actual loss was $\$ 266,31286$, exceeding the limit some sixty thousand dollars. During the fou years of Mr. Hempstead's Superintendency, the legal limit Was $\$ 235,38639$; while the actual lost was only $\$ 4,52035$ being some $\$ 230,000$ less than the limit, and, in fact, a little noder two per cent. of the amount allowed by law to be Wasted. The wastage of the Philadelphia mint is twentytwo per cent., against two per cent., wasted by our brancb mint. The total expeoditures for three years under Messrs. Birdsall \& Lott, amounted to the large sum of $\$ 1.019,275$ 39. Under Mr. Hempstead, the total expnnditures for four years were but $\$ 1,150,64814$; , phile the difference between the last year of Judge Lott and the last year of Mr. Hemstead was upward of $\$ 100000$ in favor of the latter. On retiring from the Superincturucizy, Mr. Hemstead left an
unexpended balance of appropriation due the mint of ap unexpended balance of appropriation due the mint of up
Wards of $\$ 86,000$. This certainly is a capital showing for our mint, and speaks well for Mr. Hemspstead's Superin tendency. Dnder Mr. Stevens, the present Superintendent we have no doubt everything wil work in an equally satis factory manner.
For parting silver from gold when gold
is below 300 -lo00ths. fine:
" from 300-1000ths. to $750-1000$ ths fi.

Defosits Silver Bullion-Purceases.
$\$ 1.21$ per standard ounce $1 / 2$ per ct. on gross value of all gold contained for coinage.
Refining charges (only where gold is contained) propor tion of goid 1 to 300 , 3cts. per oz. gross weight

## 301 " 500 , 7cts,

\$1 16-4-11ths cents. per staddard ounce, $1 / 2$ per ct. gross value of silver for making bars; also when gold is contained $1 / 2$ perct. on gross value of gold for coining. Refining charges as in purchases.

## Bars Sold From Rerinery.

\$1 21cts. per standard oz. $1 / 2$ per ct: gross value to be ad ped for making bars.

> Depostred for Dollars.
\$1 16-4-1l ths. per standard oz. $1 / 2$ per ct. gross value for coining, when gold is contained, refining charge the same as in purchases.

## Deposifed for Imported Bars.

$\$ 116-4$-11ths. cents per staudard oz. 1/2 per ct. gross value of deposit for making bars.
In regard to the deposits of Washoe silver, the rule will hereafter be, that the value of gold contained in the same will be paid in gold coin, and the value of silver in silver coin. The value of the silver will be calculated at $\$ 1.21$ per standard oz, and is exempted from the coinage charge, unless deposited for silver dollars, in which case a charge of $1 / 2$ per cent. will be made additional. Bullion of the above as most congruous with the physical aspects of the material, but in the warrant it must be marked that so much is to be paid in gold and so much in silver, according to the con tents reported by the assayer. The above rules, and charges were promulgated on July 10th, by Superintendent Robert J. Stevens.
U. S. Branoe Mint, Nov. 6th, 1861

On and after the 15 th inst., a charge varying in accord. ance and the character of the deposit, from half a cent to three cents per oz., gross, in addition to the geveral rates, and be imposed on all bultion deposited for coindge or manu-
facture, which will require toughening or extra refining to render it suitable for mint purposes.

Robt. J. Stevens, Superintendent.

## HOSTETTER'S STOMACH BITTERS,

They renovate, purify and strengthen the system, and aid the stumach in the performance of its functions. It is a sovereign specific for imparting, strength, vigor and tone to the system, and possessing the curative powers for all diseases arising from a disordered stomach.

## DYSPEPSIA,

In all its forms, yields to its control and invigorating pro perties, and that its return is effectually prevented and the digestive powers preserved in the fullest vigor by a subse quent occasional use of this remarkable invigorant. The disease would seem to have an infinite variety of

## SYMPTOMS:

Among these are constant pain or uneasiness at the pit of the stomach, oppression after eatiog, spasms in the stomach and diaphragm, morning nausea, $I$ ain between the shoulders, futtering of the heart, constipation of the bowels, irritability, broken sleep, nightmare, loss of memory, dimness of sight, prostration of strength, dull, stupefying headache, want of appetite, flatulency, and a feeling of despondency and despair wholly independent of external causes. All the evils in this mouraful catalogue are not merely alleviated, but invariably removed, by a few bottles of Hostetter's Bitters.

## LIVER COMPLAINT:

Persons who languish for years under apparently incurable affections of the liver, the symptoms of which are pain in the right side, pain in the back and loins, a yellow suffusion of the skin and whites of the eyes, extreme indisposition to exertion, complete loss of mental activity, despondency al most amounting 10 mania, and great budily weakness, all which are vanquished by the soothing and invigorating proprties of this restorative.
TO PERSONS WHOSE HEALTH IS BROKEN DOWN.
When the flames of life wane and quiver from exkaustion, administer this famous restorative. It will once more become steady and strong. In the debility which follows violent fever, in diarrhoea, dysentery, dyspeptic complaints and cholic; in the weakness consequent upon natural decay, or
resulting from free living or over-exertion, and also in those resulting from free living or over-exertion, and also in those
painful and too much neglected ailments to which ladies are exclusively subject, the Bitters never fail to give permanent relief.

## C.ALIFORNIANS

Should test the merits of Dr. Hostetter's Stomach Bitters. While it is highly palatable as a beverage, it is unequalled as a tonic and invigorator. In the pursuit of a fortune at the mines, many persons are exposed to attacks of complaints of the digestive organs, and of various kinds of fever.
It is the very article that has so long been in demand at the mines.

## FEMALES.

Thousands of ladies resort to it as a remedy for hysteria, futtering of the heart, nervous headache, vertigo, general debility and all peculiar disturbances and derangementa to which, as a sex, they are subject. It cheers and lighteus the depressed mental powers as well as strengthens the body, and its use is never followed by any unpleasant reaction.

> A WORD TO THE AGKD.

In the decline of life, the loss of vital force consequent upon physical decay, can ouly be safely supplied by some vivifying preparation which recruits the strength and spirits without entailing the exhaustion which is always the final
effect of ordinary stimulauls. It tones the stomach, improves the appetite, acts like a charm upon the spirits.

BOTH SEXES,
Who suffer from general debility, without any physical
pain or other symptoms of a deranged organization, will find great benefit from their vivifying influence on the frame and constitution; and where there is a deficiency of vital force they communicate the energy and vivacity which nature has The feeble supply.
The feeble girl, the ailing wife, the nursling nother, the vertasked man of business, the man of pleasure, under the reaction that follows over-exertion, and all who have a predisposition to paralysis, will do well to resort to this incomparable tonic and restorative.

DR. HOSTETTER'S STOMACH BITTERS
Should be in the possescion of everybody in the mining region. As a preventative against various diseases to which the gold seeker is liable, it has no superior. In all cases of Diarrhoea, Dysentery, and the pervading fevers consequent upon exposure, the Bitters will be found invaluable as a corrective.

## COUNTERFEITS.

Counterfeits are said to be the homage paid by knavery to success, and from these left-handed compliments Hostetter's Stomach Bitters have not been exempted. Vile imitations of the article are abroad, and the public are earnestly requested to be on their guard against them.
Sold by druggists and dealers everywhere.

VOL. VI. SAN FRANCISCO, TUESDAY, OCTOBER 7, 1862. NO. 3.

## TTELE TO Mmeral LaNDS IN THE PACIFIC sTates.

For the information of capitalists in distant countries who hare heretofore refrained from investing capital in our immense mineral lands, alleging that the laws of our States and Territories do not sufficiently guarantce security in the possession of mining property. To these we have a few facts to elucidate, which aro based on tho laws of the Federal Government, and the enactments of statutes of States and Territorios, as well ds local laws in every mining district thronghout the Pa cific Coust. The code of laws governing the right and title to mines on this coast, is precisely that of Spain and Mexico: the title to mines is vested in the United States Government; each State has the right to govern mining pursuits according to the general terms thereof, by enactmente of local laws or statutes, and each mining district has the right to agree upon a sot of rules and regulation, but these must conform to the general laws of the United States and the statutory laws of the State in which they exist; litigations and decisions are brought and ddjudicated according to this system.

In so far as the percefal possession of minerul lands are concerned, the Pacific States give ample security to citizens and aliens, and wo doubt it much whether any Europoan Government deals out equity and justice with more impartiality than do the Courts and Justices of tho Pacific States. The few eases now before the Supleme Court of this State and the Supreme Court of the United States aro fast becoming adjusted. The United States Government secures to every citizen and alion, individual and company, the right to take up mineral lands and work them, according to the terms and tenor of thelaws and statutes provided. Since no landed proprietorship exists in mineral lands, no hereditary title can be acquired. In the State of California a law exists taxing aliens, entitled "Foreign Miners' Tax," which is $\$ 250$ per month. It has, however, beon enforced only against the Chinese and coolies; aud it has recently been declared unconstitutional by the Supreme Court of this State.

We know of but one serious objection why capitalists should fear to invest in our rich gold, silver and copper mines, and this may be summed up as follows: The pernicious system inaugurated here of establishing immense companies with thousands and millions of dollars for the stock, predicted upon the belief (not upon scientifically explored mines or ming districts) of roputed rich leads or voins, with the view of throwing upon the com
mubity a handsomely printed certificate of atock, withayt the shadow of security. And here we muy remark that the laws governing mining companies or individual miners are not by half strin gent enough, and vory much requires amending The amount of work to be done on mines to secure possession, is not enough, and special legislation must soon intervene.

The quartz mines in the Pacific States are chief. ly worked by inexperienced persons, and when two or moro partios intersect their claims or approach towards each other in their tunnels, endless litigation ensuos, and oftimes bloody contegts result, thus ending with the destruction of much life and property. Special laws require to be passed cithor by Congress or the State Legislature, providing for a corps of mining engineors, geologists and mineralogists, whose duty it should be to examine every such claim ir dispute, and their decisions should be evidence befure the Courts.

Notwithstanding these disadvantages, which are merely the result of inexperience and circumstances, ushered into existence within the past fow years, no country in the world has ever presented a greater field for acquiring wealth, as the Pacific States. The gold and silver extracted from one or two countios in Nevada Territory during the past year has amounted to over ono million dollars per month; and, from present indications, it will not fall short of three times that amount in a year hence.

## A GOOD MOVE FOR POOR INVENTORS.

An excellent move has been made by one or more of our citizens to establish a scientific association and stock company, for the purpose of aiding inventors and discoverers in bringing before the public valuable inventions, which is to operate as follows : The society shall consist of a number of stock or shareholders, the amount of which shall be established at the adoption of the constitution, payable in montly instalments or dues thereto. The association will after a sufficient amount has been paid in, acquire with this means all the apparatus, utensils, machinery, library,
ett., requisite for making models, testing and etc., requisite for making models, testing and making experiments, and complete the ideas of inveniors who may not bave the means to do this themselves. The association is to undertake, after a satisfactory examination of the invention, and obtain a patent therefor, subject to conditions made between the inventor and the association; and from the proceeds and emoluments of such inventions, the society expect to receive dividends, at the same time furthering thie interest of the poor inventor.
On next Friday evening, at 8 . o 'elock, a meeting will take place at the Mechauics' Institute, - when a full attendance may be expected:

## BAD MANAGEDIENT IN CONDUCTING FAIRS.

We have repeatedly stated that the conduetors or directors of State and district fairs and exhibitions, do very little towards encouraging science, arts and manufactures. It is a fact well established that thousands of dollars are made up in purses for the best cow, call, horse, ateo, whioh requires scareely any science or skill to produce, when compared with a useful and novel piece of mechanism, which may have taken years of thought and labor to finisb, and the application of which would cause economy of time, labor and profit, The most an artist or mechanic may expect for his skillful production, is a diploma, or a medal probably not worth $\$ 5$ !
The various associations abroad have been noted for eneouraging.the sciences and arts; hence the mechanic and artisan have an incentive to produce inveritions which will hand down his name to future generations, and the advantages arising from his production may prove beneficial to the whole human race! We can only account for this shortcoming by surmising that the mechanic and artisan are not solicited to take part in the organization and proceeding of such aissociations.

California Quicksilver. - Without quicksilver very little gold could be obtained from the mines of any country. This metal is a most subtle searcher for gold. Quartz, in which not a trace of gold could be observed by the naked eye, has been made to yield $\$ 250$ to the ton of the genuine metal, and all by the quicksilver "llicking it up" and forming it into a pasty mass. Quicksilwer is to the miner what steam is to the engineer. Californi2 posssesses extensive quicksilver mines, from which she not only supplies not only supplies her own miners, but furvishes the liquid metal in large quantities for the miners of many other couutries. The exports of quicksilver from San Francisco since January 1st up to August 1st, have been as follow:
China, : 8,674 flasks $\left\lvert\, \begin{aligned} & \text { Peru, - - } 1,258 \text { flasks } \\ & \text { England, }-1,000 \text { " }\end{aligned}\right.$ Mexico, - 7,837 "" England, - 1,000 Australia, 1,050 " New Yark, 625
$\begin{array}{lr}\text { New York, } & 625 \\ \text { Vancouver, } & 99\end{array}$
Total,
21,552 flasks The Chinese use mercury for making that beautiful pigment vermillion.-Bell's Nantical Mayazine.

Thanks-To our Honorable Representatives A. A. Sargent and T. G. Phelps, for Patent Office Reports on Agriculture.

Henry Clay Co. have located the first north extension on the Vesuvian Lodes Nos. 1, 2, 3 and 4, and the Old Town Co. have located the first north extension on the Mohamedan Lodes Nos. 1, 2 and 3. There are some fifteen tunnels now running into these mines sout Clear Creek, and from the rock shown therefrom, and the fact that a steam mill is now being constructed for the purpose of reducing the ore, we are of the belief that good and reliable mines are found near to Carson City. We have seen an assay of Max Zorer No. 1 rock, showing $\$ 7647$ in gold and $\$ 1,23242$ in silver $-\$ 1,33889$ per ton. Also assays from Max Zorer Nos. 2 and 4, which show from $\$ 527$ to $\$ 550$ per ton, and one assay from Mt. Moriah Lode No. 2 as high as $\$ 415$ per ton. These assays are all made from rock taken at from two to ten feet from the surface. These mines are only about three miles from Carson City, with a good graded road direct to them; having the advantage of water-power sufficient to propel thirty mills with ove hundred stamps each; timber for the mines; lumber for the mills, buildings, etc., and thousands of cord-wood at from two to three dollars per cord-all about these mines, affording advantages which none others have in the Territory.
The mill, formerly Stewart \& Hennings, js now owned by Messrs. Raymond \& Thompson, who have torn out all the old apparatus and put eight seven. inch tubs in, with a view of working ore by the "sage brush process." They have also two of Wheeler's new invention of amalgamators, which they have put up for the purpose of testing as to their adaptability and utility in saving wetals both of gold and silver We have the authority of Mr. Hrss, a gentleman of much practical experience in such matters, for saying that they are not only a success, but are destined to nork a complete revolution in the mode of amalgamating, throughout the silver mines. This mill is running from eight to sixteen of the twenty-four stamps, but has not tubs enough yet to put the mill to its full capacity. They tock out 91 pounds of bullion last week; it was the product of 40 tons of the third class of Ophir rock. Such a rock was formerly counted as "re fuse," but since the introduction of appropriate machinery and reliable modes of working silver rock, it pays remarkably well, and gives another assurance that we have millions if tons of pay rock in ledges partially abandandoned, and in rock which has beretofore been "dumped " away as useless. The mill is now in excellent condition and will, undoubtedly, give good satisfaction to the owners and the public. Its ca pacity, when completed, will be about 25 tons per day.
'The Ellsworth company's mine, situated about a mile south-east of Silver City, is turning out a large amount of good and some first-rate ore. In one apartment they got about three tons per day of ore that will pay $\$ 150$ per ton. This is kept by itself while all the rest goes to the mills just as it comes from the mine.
Mr. Welch has commenced work on the great Ophir tunnel, which is to strike the ledge one thousand feet below the surface.
Esmeralda.-The Star of the 13th inst. says: Last week the following mining companies were incorporated, and the articles sent on to be filed in the office of the Secretary of State:
The first North Extension of the Winnemucca Gold and Silver Mining Company, 1200 feet; 1200 shares; capital stock, $\$ 120,000$. Trustees, Dr. John Ives, Geo. Smith and
The Colonel Corcoran Gold and Silver Mining Company, 600 shares, $\$ 60,000$ capital. Trustees, P. G. Vibbard, 'I

The George Emmett Gold and Silver Mining Company 600 shares; capital stock, $\$ 60,000$. Trustees, Dan. Morgan B. S. Mason and P. G. Vibbard.

The Vibbard Gold and Silver Mining Company, 600 shares ; capital stock $\$ 60,000$. Trustees, same as preceding

The Doyle Gold and Silver Mining Company, 600 shares; capital stock $\$ 60,0000$. Trustees, John Doyle, B. S. Mason
The Isaac Gold and Silver Mining Company, 600 shares, capital stock $\$ 50,000$. Trustees, Robert Isaac, B. S. Mason

Stock Quotations.
[corrected wekkt for tie "priss."]
E. O. Taylor. McLaughlin and B. S. Mason company and P. G. Vibbard. and P. G. Vibbard, have cities of ten thousand inhabitants, and produce bul have cities of ten thouzand inhabitants, and produce bul-
lion at the rate of fifty million dollars per annum. This
may be extravagant, but we believe it will be rather may be extravagant, but we believe it will be rather under the mark than over it. No ope can now accurately guess at the future magaitude of our progress, becanse not one in a thousand gives to the mines their true palue, or adequately comprehend their vast wealth. As the truth gradually dawns upon the public mind there will be a corresponding expansion of ideas until the whole truth is revealed, or until the fountains of our wealth have astounded and bewildered even ourselves.
Considerable excitement has been manifest about the Clear Creek mines during the last wfek. The Georgetown Company have located the first north extension from the Porto Plata Co's claim on Porto Plata Lodes Nos. 1, 2 and 3. The Break of Day Co. have located the first north extension on the Gilead Lodes Nos. 1, 2, 3 and 4, the Syrian Lodes Nos, 1, 2,3 and 4, and the Barcelona Lodes Nos. 3 and 4. The EI Dorado Co. have located the first north
extension on the Barcelona Lodes Nos. 1 aud 2. The
The Silver Age of the 5th inst, thus holds forth : No one-not even the oldest resiaents here-could surbring himself up to a just conception of their vast wealth now, or what they will be a few years hence. It is impossible, because there is no parallel or premises from which to
reason. People are astounded that a desert conntry like ours, but three years ago aluost uninhabited, now contains more than twenty thousand inhabitants; has cities of two and three thousand people; mills in great numbers, of un equaled size and prodnctive capacity, and mines yielding at least twelve million dollars per annum, while nine-tenths of
the really valuable claims are not yet developed. Our progress has been wonderful, but we, ourselves, cannot believe or surmise what mighty strides we will make in a few years to come. In three years we predict that our Teritory will have a population of at least one hupdred thousand; will

Few, even of our own citizens, are fully aware of the incalculable wealth of Plumas county. In the early days of California the class of miners who came to this county, was in no wise different from that which diffused itself throughout the mining regions of this State. Placer and river diggings were all they sought after-each one was anxions to make his "pile" add then return to the Atlantic States-1hey came but to ravish the country and then desert it. But many, very many, soon learned to love the land they came to destroy. And these cast about them for a more permanent location than was afforded by the shallow surface claims, which could be worked out in a few weeks. Then it was that hills and deep diggings were tried-tunnels were run, and long ditches dug, at a great expense; for the purpose of conveying water along the sides, and even up to the tops of the hills; bydraulic power was used to detach the earth and debris from tho precious metals ; and a new era in mining was inaugurated. The Mount Pleasant, Spanish Ranch, and a number of other ditches of lesser note were constructed between '53 and '58, and the hills of Plumas were forced to surrender large quantities of their long hidden treasure to the industrious and enterprising miners and ditch owners-snd Plumas was in a most flourishing condition until the Fraser River excitement broke out in the summer of '58, when many of our nomadic miners left their valuable claims to seek new fields. But the majority of those who left were in the condition of the dog in .Esop's Fables, which was crossing the stream on a $\log$, with a piece of meat in bis mouth, and seeing his own shadow in the water, let go the piece he had and jumping at the shadow, lost what he possessed and found nothing in return. Hundreds soon returned, and Plumas county began to be more thoroughly prospected. It now became evident that the numerous quartz lodes in which our mountains abound contaned untold treasure. Washoe had been discovered with her fabulous wealth—and this gave a new impetus to this system of mining, and men turned their attention to developing the quartz lodes of ont own county: their efforts have been crowned with such success that this county, at no distant day, is destined to become one of the most important mining counties in the State. Already the Eureka, Mammoth, Seventy-Six, and other quartz lodes, have been prospected and found to be rich. The Ellis ledge was discovered in Round Valley, and it was found to be but one of a great number of equally rich lodes in the same locality. Rich gold and copper lodes were discovered in Gennessec Valley-and now we hear of new and valuable gold bearing quartz lodes being discovered at Rush Creek, Rich Bar, Taylor's Creek, Indian Valley, Nelson Point, Twelve-Mile Bar, and, in fact, nearly every other portion of this county.-Standard.

The Colorapo Mines.-The area of the Colorado mines is extending, and is supposed to embrace the Apache country, in which event the white prospectors will eventually bring on an Indian war. The first mines are in the foothills skirting the Colorado river, and several miles from the stream. The gold is gathered by dry-washing, water being so scarce that it is packed from the river or from wells for drinking purposes, and sold for $1 \bar{n}$ and $2 \overline{0}$ cents a gallon. A town called Olivia, after Miss Olive Oatmau, the Indian captive, bas been laid out, and contains about a thousand inbabitants. Gold rates at $\$ 16$ per ounce, butis said to be worth \$19. A Recorder has been elected. No Fhinese, Indians or negroes are allowed to take up lots. The new community may be regarded as the corner stone of a permanent settlement in that region.

The certificate of incorporation of the Moss Gold and Siler Mining Company was tiled in the County Clerk's office on the 18 th inst. Their mine is in Story countr, N. T.

## Mentul Epidemate.

In Frazer's Maguzine for April, this year, speaking of m+ntul epidemics, an article conelutes thus:

The question of course sughests its If. What probability is there of a periouli al recurrence of popphar dehasions such as th se to which we have here adverted? What secuity aguinst them is ufforded by extended education and advancing civilization? In our upinion, we do not hesitate to confess it, none whatever; not even were education as generally diffused as n's most ardent advocates would desire. It is at
least a stgnificant fact that Scotland and America, the two countries in which education is perhaps more general than in uny other, have been foremost in these cutbursts of fanaticism, and have rivalled or even outstripped Ireland in the lengh to which their extravagances have been carried. Must prople have by this time surrendered the once pupular tonet that superstition and fanaticism were to be forever dispelled by the lisht of seience.

Filucation and so-called general enlightenment are. in truth, utterly powerless in the presence of spiritual emotions; even the growisg skepticism of the day offers no bar to them, if it dues not actually prepare men's minds for them. It is true that most of these delusions, of hater years, especiully, have been restricted chiofly to the lowest and least educated classes ; but a little reflec ion can scarcely tail to force upon us the conviction that the ligher und better edacated have owed their immanity rather to accidental circumstances and the peculiar forms which these delusions have assumed, than to any security conferred upon them by their position and mental cultivation agaiust the grossest absurdities of credulity and superstition. Recent experience, indeed, bas given much cuuntenance to Dr. Babington's remurk, that "among the educated classes the uffiuent are more credulous than thuse who are dependent on' their own exertions for support." It is a puint in which the extremes of society might be said to touch. The wilder forms of superstition and fanaticism have flourished at one end of the social scale -the scarcely less extravagant fullies and absurdities of mesmerism, table-turuing, and spirit-rapping, have found th ir dupes in the other: the intermediate class, the merchants, trudesmen, and, speaking generally, the members of the learned professions, in this country, at any rate, have been uninfluenced by either. We do not remember anything less creditable to the good sense and intelligence of English society thau the belif in table-turning, so general a few yeurs ago. Spiritualism, which bids fair to take its place, involves graver questions, though its pretensions appear to us to be abundantly refuted by its own monstrous absurdi
ties. But we must not enter into this subject ; possibly we may recur to it on some future occasion.

## Tho New Ironsides.

The iron-clad frigate is so far advanced that she will make a trial trip on Monday next, after which she will be taken to the Navy Yard and dismantled before proceeding to sea. On Saturday the engines of the frigate were in operation, and worked salisfactorily. Her machinery is of great power, consisting of two horizoutal direct-acting engines, with cylinders of fifty inches in diameter and thirty inches stroke, intended to make 85 revolutioas per minute, and to drive a brass four-bladed propeller, of thirteen feet diameter and eighteen feet pitch. The boilers are foyr in number, known as horizontal tubular, each being seventeen feet front, eleven feet deep and eleven feet high, of a collective force of 1600 horses. Though the boilers and machinery and coal bunkers occupy considerable space, there is ample room for the officers' quarters and the accommodation of the crew. The New lronsides has but three decks-the orlop deck, in consequence of the high draft of the frigate, being dispensed with. On the spar deck the circles have been laid for the pivot guns, and the joiner's work is in a very forward state A number of joiners are at work on the gun deck, fitting up the captain's quarters, which are spacious and well lighted No other officer is allowed a cabin on this deck, but all, from the lieutenant down, are quartered on the berth deck The cabins of these, with the ward rooms, are ready for oc cupancy. The total number of officers on board the Ironsides is about thirty. These include the commander, lieutenants, masters, surgeone, chaplain, engineers, lieutenant of marines, midshipmen, master's mates, paymaster and clerk; boatswain, gunner and carpenter'.

Though the Ironsides is the same tonnage as the Wabash she will not carry as large a crew, inasmunh as she is to be dismantled before going out. The armament of the trigate, consisting of sixteen 11 -inch Dahlgreen guns on the gun deck and two 200-pounder Parrott guns on the spar-deck, has been received at the yard, and will be put on board as soon as the iron carriages are ready. This week she will receive her coal and ordnance stores.-Phil. Ledger, Aug. 4.
Snow Spots on the Eastern Slope.-As an evidence that the last was an unusually severe winter, we may mention that large fields of snow are still visible from Carson City, a oircumstance which bas not occurred on the 1st of Septem-
ber for many seasons. Some places in these snow felds ber for many seasons. Some places in these snow fields are
said to be 20 feet deep yet, so that there is no probability said to be 20 feet deep yet, so that there is no probability that the snow will melt off this season.-Silver Aqe.

## EDITORIAL CORRESPONDENCE

## Tour through Sacramento, Folsom and Linooln.

Piacerville, Sept. 15, 1862.
We left San Francisco elated with the hope of breathing once more the salubricus mountain air, and bid adieu for a short while to the bleak winds, sand and dust of our great metropolis. It has its charms as well as its ills, and we chose it "for betteror for worse." The Chrysopolis, that floating palace, glides swiftly through the bay and up the Sacramento, where we arrived after a sound "snooze." The thermometer must have been $110^{\circ} \mathrm{F}$. at the capital, which makes everybody puff and blow. Sacramentans, despite their late reverses, seem buoyant and sanguine of their future and that Eden seems again in its wonted splendor, abound ing in luxuriant gardens and shade trees throughout the euburbs. After a short sojourn at the crack hotel, the Ebner House, we took leave of our friends, and "rolled on heavily" towards Folsom. Mine host, that social "cuss" of the Patterson House, received us well and hospitably. The insufferable heat does not seem to abate, and we were compelled to have recourse to our white donnings, which caused us immediate relief. Folsom, as will be seen elsewhere, is one
of the most prosperous towns in this State, presenting many
natural advantages to the enterprising; but its present pop ulation seem anything but literary, scientifically inclined, o willing to listen to matters pertaining to their benefit or ad vantage. Through a polite invitation, we attended the or ganization of a new Odd Fellows Lodge at Lincoln, Placer county, entitled Valley Lodge No. 107. The services occupied "all night till broad day light," with danciag and colation, wine and toasts. Lincoln is the terminus of the C. O. R. R., a very pleasantly situated town, seemingly in a pros perous condition. Stages in every direction wend their way from this point. Teams and conveyances are laden with freight and merchandise through the well-known forwarding houses at that place. Hotels and accommodations are ample. The surrounding country is thickly settled and the agricaltural pursuits are flourishing.
We leave it, and take our departure for Placerville, El Dorado county, and the usual courtesies are denied as by that opulent stage company. We are somewhat disappointed at the bad state of the roads at this season of the year Mining is being prosecuted with but little energy-here and there only are claims being worked: the majority have no water. Placerville is a splendid mountain city, surrounded by verdant hills and mountains, many of which are being worked for their metallic riches, paying handsomely to their enterprising owners. Although mining has been but superficially carried on, and is by many miners believed to be "played out," which is far from being a fact. Little work in this vicinity, and would readily yield from $\$ 15$ to $\$ 20$ per T'he Pacific Quartz Mill appears to be the only successful establishment of the kind here. The placers, ravines and gulches still pay moderately good wages where water is bundant.
The city of Placerville contains from 5,000 to 6,000 inhabitants. It is situater in a valley, dirided into Upper and Lower Placerville. It is the entrepot of San Francisco and Nevada Territory, where all the travel and freight seem to form a centre and stopping place, and where the great trunk of the Pacific and Atlantic Railroad must come.
The great thoroughfare, Main street, is neatly laid out, and substantial buildırgs and edifices are studded symmetrically thereon, which for architecture and convenience do not fall short of San Fiancisco struclures. We were agreeably surprised to find the Cary House the first hotel in this city, in every respect equal to the Lick House of San Francisco,
in all its appointments. The affable proprietor, Mr. Cullen, has but recently returned from the Atlantic States, and is now the sole proprietor. This hotel contains 80 spacious apartments, capacious halls, beautiful parlors, dining salooqs, etc., all of which are well ventilated, and provided with gas,
The Cary House is a three story fire-proof brick edifice, The Cary House is a three story fire-proof brick edifice, situated on Main street, Lower Placerville. The chief business change, postal and express matters are forwarded and transacted, and the stages and conveyances halt and take their departures.
J. S.

Mr. Lapone has just completed the erection of another quartz mill at the intersection of the ravines in Silver City, and just opposite the McNulty mill. It is presumed that the entire winter will be consumed in building this mill, and

## SUTTER PIONEER TESTIMONYAL FUND

At a mecting of the Society of California Pioneers, held to celebrate the Twelfth Anniversary of the admission of Califurnia into the Union-
At the conclusion of the address of E. H. Washburn, Esq, Dr. Heary M. Gray remarked that as there was an unusually large number of the Society present, it was a fiting time to consider informally some important suggestions embodied in the remarks of the orator of the evening.
That portion of the audress having direct reference to General John A. Sutter, then elicited an interesting discussion. Mr. Sam. Brunnan then gave an account of a recent visit to the old Pioneer, and others warmly advocated the adoption of immediate measures for his relief. H. F. Williams offered a series of resolutions to this effect, to which some amendments were proposed. Subsequent'y the Society appointed Mr. Williams, W. B. Farwell, Dr. Gray and Rev. Albert Williams a committee itic revise the same, who reported the following, which were unanimously adopted
Whereas, Tho Society of California Pioneers are desirous of presenting to General John A. Sutter a substantial mark of their g.atitude to him for his many good and charitable deeds towards the early settlers of the State, and of the esteem in which he is held by his fellow-citizens at large : therefore,
Resolved, 'hat a committee, consisting of all the exPresidents of our Society, be, and the same are, hereby constituted a Committee to take the matter in charge, to appoint sub-committees, and prepare subscription papers, to be circulated for costributions to a fund to be judiciously invested for Gon. John A. Sutter.
Resolved, That the President, Secretary and Treasurer of this Society, and their successors in office, be, and the same are, hereby constituted a Board of Trustees, to receive and invest all funds which may be received in furtherance of this bject.
Resolved, That copies of these resolutions be forwarded to all the newspaper editors in the State, with the request that they will publish the same, and urge upon their readers the propriety of contributing something in aid of the fund.

We have been requested by the Committee, and it affords us pleasure to give place to the above action of the Society of California Pioneers. It is understood that Gen. Sutter, the most distinguished of the early settlers of this State, has, through the generosity of his nature, and that unsuspecting probity which always attends on conscious wortb, been deprived by the shrewdness and trickery of unprincipled men, of the ample competency which he had secured for himself and family, by his early toils, hardships and labors, in the settlement and reclamation of this country;-Insomuch, that his condition is now said to be one of almost absolute want and destitution.

General John A. Sutter may be, in fact, considered as the Pioneer of California. It was he who received so cordially and treated so hospitably at his fort, on the Sacracramento, the first expedition of citizens of the United States to this coast. made by Col. Fremont, in 1846. Fremont, in his Journal, speaks of him in highest terms of commendation. It is, therefore, exceedingly appropriate that the Pioneers should do him honor, and, if need be, give him aid in this his hour of trial and distress. He received and kindly fed and sheltered our worn-out and famishing countrymen, debilitated and exhausted by the sands of the desert and the snows of the mountains-at a time, too, when relief was salvation. It was also from him that much useful information was obtained by the first explorers, pelative to the character of this country. It was, too, at Sutter's mill, it will be recollected, that the first gold was discovered in 1848 ; and hepce the joyful news went forth which startled the nations, as it pere, from the lethargy of ages. It was in digging the race at Sutter's mill that the first discovery was made which has in the course of twelve short years, placed California by the side of old and papulous States.
Who, then, will nat say, "All honor to the good old chivalrous Pioneer?" It may be well said that this State is more indebted to him than to any other iudividual in its wide circumference. We then say, God speed to the good work ; and all honor to the noble Pioneers who have set this ball in moţion.

Laoe Manufacture.-'The growth and importance of this branch of industry may be learnt from the statements made by Mr . W. Felkin in 1856 . He calculated that the returns fram the Lace Manufacture exceeded $£ 4,000,000$ a year, the number of hands was 135,000 , and of machines employed 3500. The machines are now estimated at 4,000 . By the ariginal mode of making lace upon the pillow, five meshes of "plain net" could be made per minute ; 40,000 meshes per the finished pieces was 40s, the square yard; in 1856 , 6 d .

## LASD FOR THE MLLLIOS

If anrman is in the posiession of a tract of land of not Less ihan to wer more than 320 acres o laua, or tavens where there are such tracts iha be would lise to parchase, that are not owned pasessai by ary uther person, the following in formation may be both useful and desirable
The Trited States srstem of surreriyg dirile the State juto squares of six miles eacl, called Townsitips, anci suldirides these into squares of one mile each, called Secrions, as the foilowing diagram will show:

BJ 4 cts of Con gress, the 10 tis and 3ith sections in each fall township. and due propor tions for the fractiomal tomuslips, are domated to the Siate for common school parposes,
And where the 1 unh or 3uth section is incluaded in a mil? jtary or other reserre, or in a private grant, the Suate has the pririlege ot selectiog ant uther seco tions in the proper land distriet, in lieu of such reserved or appropriated sections.
By Act of the Legislature of this State, approved April 22d. 1E61, sections 16 and $30^{\circ}$ in each sownseif. and orber sections taken in jera thereof, are anthorized to be sold at the low price oi one dutar and ement- itre ceats per acre, in legai subdirisions ot 10 to 820 acres.

WM. W' DESN'S PATEST ROCK DRRLL.
The accompanyiny rock drilling machine is an ingeneous invention, particularly valuable to the quartz miners on the Pacific Coast. The engravine, though coarse (it not being exeentel at our offiwe), yet presents the mathine sufficiently plain and comprehensive. The inventor is Mr. Wm. W. Dunn of this city.

One man with this machine can do the work of about four men in the orlinary way. It is portable, made eutirely of iron, and weighs abont 80 pounds. Its prineipal use is in mining operations. Placing the machine in the shaft or tumnel by screwing nut the screw on the end of the expanding stanchion on which it is supported, and thus bracing it firmly between the top and bottom, or
one end-with, at the other end, standards supporting the drilliner machincry, by which the drili can be operated horizontally, perpendicularly, or in any direction. The drill has a regular turning motion, at each blow, feeds forward fast or slow, (at the option of the operator, ) as the character of the rock requires: the rate of advance can be varied instantaneously. The blow is struck by the drill being drawn back by cams, thus compressing a cylindrical indiarubber spring, which expanding projects it with great force. The number of blows per minute is only limited by the durability of the steel drill, 120 blows is the usual rate. These machines can be operated by hand, horse or steam power. A 4 horse power engine operated by one man drives a machine capable of urilling 4 to 6 inch blast holes, 4 feet deep in

sides of the tunnel, one man can with ease work the machine and turn the crank 40 times per minute, and the drill strikes three blows for each turn, giving 120 blows per minute. This machine has been successfully tested in the Eastern States and this State, where the hardest rocks abound.
This machine occupies so little space that in a tunnel five feet square two of them can be worked, equivalent to eight men, when but two can work, in the ordinary way-not only a great saving in cash expenditure, but also of time, is effected.
A one horse power machine performs the labor of 12 men.
Mr. Dunn is also the agent for Mr. Gardner's patent of a portable steam engine, to be used in connection with the above drill. It consists of a
truck frame on wheels, bearing a steam engine at
granite, or 6 feet in bard limestone, per hour.
The cost of drilling the holes is reduced to onetenth the present expense, while the whole saving on a rock excavation of any extent, cannot be less than 50 or 75 per cent. on the entire work.
The one horse power machine performs the labor of twelve to thirteen men, in driving bed-rock tunnels and open cuts. It is worked by atmospheric pressure and ventilates the tunnel at the same time.
The band drill is another form of machine, by use of which one man can do the work of three. It is expressly adapted for tunnels, galleries, shafts, etc.

For particulars address Wm. W. Dunn, Fremont street, near Market, San Francisco.

## to aining companies.

We earnestly solicit from mining companies and associations the fullowing blank statement, filled according to the data hereby accumpanying. The purpose for which we seek this information is importaut to every citizen and stockholder on this coast ; it would also be prodnctive of beneficial results-i. e., inducing cupitalists to invest in our mining operations, thereby infusing new life and vigor into business generally in our States and Territories. Little, if anything, is known of our metallic wealth in Europe or the Eastern States, hence we desire as much of the blank filled by you as may be interesting and instructive to the people of this State and those interested abroad.

We know of no mining district in Europe or America where this kind of information is not willingly rendered by parties owning property of this nature ; and we know of no better medium for making public the richness of our mines. We shall send blanks to mine and mill proprietors for every quarter, and will gladly publish the contents for the information of the community:

[From the Silver Ago ]
Letter from our Conmissioner to the World's Fiair.
The-following letter has been received from the Commissioner of Nevada Territory to the World's Exhibition, London, by his Excellency Governor Nye, to whom we are indebted for a copy for publication. It will be remembered that our Legislature at its last session made an appropriation of five hundred dollars to defray the expenses of a Commissioner to represent our Territory at the
Great Fair; a sum insufficient, as was understood Great Fair; a sum insufficient, as was understood nothing of the other expenses of any one undertaking the journey. But our Legisls.ture, in view of our many home wants and the slender revenue of the Territory, did not feel warranted in making a larger appropriation at the time. That it would have been good policy to have sent on at least two or three well selected men accredited to that mission can hardly be questioned, judging from the tenor of this letter. Finding no other competent person willing to make the journey at so great pecuniary sacrifice, Governor Nye appointed Mr. Jo-
seph Mosheimer to the Commission. The selection was a good one, this gentleman being an old resident of Washoe, and thoroughly acquainted with its wants, resources and future prospects, besides being a practical metallurgist and owner in our mines:

London, June 22d, 1862.
Gov. J. W. Nye-Dear Sir: In my last letter to you I mentioned my visit to Washington, after tination, arriving here on the 15th May. My first business was te ascertain who were the American representatives at the Exhibition, and found Mr. Holmes Acting Commissioner for the whole Department, which consisted of a place in the eastern corner of the building about the size of the Contra Costa Agricultural Rooms. Mr. Holmes endeavored to procure more room but without success. If found
it difficult to get sufficient space wherein to place a glass case containing my Washoe collection of ores. I found some specimens of ores from our Territory already here, which togetber with my own made a very creditable show; and, I think, we can justly claim to have surpassed our mother State of California in this respect. She sends on three Commissioners, and has on exhibition only a small pump from Mr. Hansbrow, of Sacramento. The ores I have on exhibition are from the Ophir, Mexican, Gould \& Curry, Chollar, Gold Hill, Sacramento Ledge (Silver City) and the Daneybeing some of the richest samples ever taken from these mines. I have also a large specimen taken from one of the leads in the Esmeralda district, and a number from Humboldt. They excite much curiosity here, attracting the attention of moneyed and scientific classes in a special manner. Sir Roderick Murchison, the first geologist of England, was much interested in the collection, and invited me to his house to have a talk about our Territory. Two days ago the Prince of Wales came to our court, and Sir Wentworth Dilke showed him our ores. I opened the case, handed him the several
samples and explained to him their character. He examined them with care, thanked me for my trouble and departed, bearing himself in the most modest and unassuming manner.

It is a pity, both for the credit and welfare of our young Territory, that certain parties largely interested in her mines, did not see fit to act more liberally in the matter of sending on samples of ores and otherwise giving encouragement to the Exhibition. As an excuse for this narrow course of policy, the president of one of our mining companies assured me that he did not think itexpedient to let the politicians have thech light in regard to the riches of their mine. There are those, howevor, who would be greatly benefittee by having
value of their claims daly understood abroad.
Silver mining is a wakening more interest in this country now than ever before. They have more confidence in it here than in gold mining, in which many were heavy sufferers by their trials in California.

The question is often asked what title have we to our mines. On being assured that they are on

Government land, every one is satisfied. They are afraid of the Spanish titles which have caused so much trouble in California. I am surprised to find how little is known about our Territory, not cannot credit the statement thal we take out about a million dollars' worth of silver every month. This is because so little is said about the matter in the public prints, and all the precious metals raised in the Pacific States is accredited to California. There has been but little published about Washoe whereby the monetary and scientifworld could be intelligently informed. Were our resources and situation well known here we could readily command the means for building a railroad to California, as well as all needed capital for opening and working our mines-a condition that would greatly increase the value of every species of property in the Territory. To illustrate how little is known of our progress, even among
intelligent classes here, I may mention that I found it difficult to convince a gentleman who had examined our mines in 1861, that we had now fifteen hundred stamps running; because, as be said, it would take years to accomplish this. I only convinced him by showing a list of the mills now running or in course of erection in the Terri-
tory. There is not much useful machinery for mining purposes on exhibition here, and I am of opinion we could teach these people something in the business of gold working.

I am your Excellency's ob't serv't,
Jos. Mosheimer.

## From the Coso Mines.

We copy the two subjoined lettors from a late number of the Visalia Delta:

Willow Sprivgs, Coso, Sept. 15, 1862.
Editor Delta:-I notice from your paper that the people of Tulare Valley have finally aroused to a sense of duty and interest by commencing a trail across the mountains from Visalia to this place, and other mining localities in this vicinity. It is only surprising that they hare not done so long ago, for every observer must have known that Tulare Valley is the natural market for tbis whole country, if the roads and trails were made passable for freight trains and teams. The trade from the different mines on the Elastern slope is fast growing into importance and must, from all appearances, soon be immense. Large amounts of goods, \&c., now come to us by the way of Los Angeles, which naturally should pass through Visalia.

The Coso mines are opening out in the most satisfactory manner. The Josephine lead has a shaft sunk on it about 75 feet deep, and the vein is much larger and richer at that point than any place above. There is no doubt that this vein is exceedingly rich. The Winoshick, Watab, Caledonia, Docow, Great Eastern, Great Western, and many other leads in this district, are turning out remarkably well. To work these successfully, silver machinery is necessary, and Mr. Hitchens, the owner of several of them, and the proprietor of the Pioneer mill in these parts, has started to San Francisco to procure a "process" and pans which will save the stuff that our veins doubtless contain.
The Lotta mills are doing a fine business crushing Josephine rock. Hitchens' mill is principally used in prospecting the rarious leads which are being opened in different parts of the mines-some of which will be heard from soon in a manner to astonish the oldest man in the community.

The Indian troubles have finally ceased to scare the timid or to retard our progress, from the fact that a military post has been established on Ow. ens' river, and we all foel secure in our lives and property and the pursuit of happiness.

The news from Owens river is encouraging. The Union mill has started, and all looks well. Persons continue to arrive daily from the Slate Range and Argus districts, who bring with them "unmistakable evidence of the boundless wealth of these places.
From the signs of the times, next summer will be a lively season on this side of the mountainsthe sound of the quartz mills will be heard in one continuous clatter from one end of the range to
the other, and the returns of the express men will
mow that Tulare is not only the finest agricultura and grazing portion of tho State, but that her shines are unsurpassed in any quarter.

Coso.
White River, Sept. $16,1862$.
Mr. Editor:-Thinking that you may wish a little more information in regard to the extent, richness and locality of the late discovered gold mines (in quartz) on the north fork of Kern River, I embrace this opportunity of affording you all I can from actual observation, and from what I have heard from athers on the ground. Shakspeare says "there is a tide in the affairs of men," \&c. How beautifully true. It is an ever rushing cur. rent, which some try to stem, while others glide along in its eddies or down stream with ease, to that final destiny awaiting us all-no matter how good or bad the result, in the estimation of those who live, they must acknowledge the equality of the bone-yard : for with all our greatness we leave but little shadow behind. But whether it was flood or ebb tide that rushed me from the classic shades of Tailholt, over the rugged and romantic cliffs of Kern River, the future must determine in this letter. Perhaps it would be well to give you a description of the country passed through before reaching the mines, together with the events that incidentally transpired in a trip tbrough a country so little known, even among ourselves, although perhaps of but little importance.

The first place of note after leaving White river is Linn's Valley, which shows unmistakable evidences of the late deluge. Acres which were last year covered with grass, are now strewn with drift wood and buried in sand. Still that does not mar the beauty of the valley, nor depreciate the value of the farms much. A change bas also come over the spirit of its industrious and frugal inbabitants, for this year, at election, they gave a Union majority, where last year it was furiously and bitterly secesh. So much for the dawning light of civilization. The road completed last year by the Linn's Valley people over the Greeaborn mountain, is at the present impassable for wagons. Marsh's mill on the top of the mountain, is partially destroyed, and whether they will ever use it again for crusbing quartz or not, is uncertain, as quartz mining in the neighborhood is for the present suspended. The view of the surrounding country from the top of the second summit, going towards Kern River, is grand. The river winding along through deep chasms, the mountains and abrupt declivities looming up towards the heavens, and covered with stately and silent pines, impresses the mind with the grandeur of nature and the power of God, and makes a picture impossible for pen or pencil to describe.

Greenhorn went Union this year - another change. The road from Greenhorn to Keysville is very rough, though I passed people taking wagons with them and going to Owens River; and, from some little and big domestic ovidences they had along with them, I think they will be comfortable over there. Upon my arrival at Keysville I could not but notice the silence of the city, espe cially after living in the busy city of Tailholt. The cause is said to be the fact that all the inhabitants belong to the Good Templars. There are seferal business houses in Keysville, also two hotels, at one of which I put up, without being asked if I had any baggage, or to pay in advance before sampling their hash. A liberal style-though in some places the landlords would consider it dangerous. Now for the mines. After going up Kern river from Keysville about nine miles, the first evidence of the new mines that attracted my attention was the quartz mill of Rogers, Caldwell \& Co., on the north side of the river-a water mill. They were cleaning up the battery when I arrived, and obtained some thirty pounds of amalgam from rock crusbed in four days, which I think is very good, considering that the eapacity of the mill is only about three tons in 24 hours. The gold is worth $\$ 15$ an ounce. The rock has to be burnt before it is crushed to obtain the gold from it, as it is full of something that prevents the quicksilver from taking hold of it, unless it is burnt. [Sulphur, prob-ably.-ED.] The most of the leads are within half
a mile of tho mill of the first discoverers，but somo aro about two railes above and below．In the vi－ cinity of the veins a person becomes surprised and interestod to seo such masses of rock on tho sur－ face，which havo been walked over by tho minere for yoars，without examination，for tho reason that no quartz miner ever dreamod such stufi contuined gold．It doos not look liko quartz，although tho veins are well defined on the surface，aud perpen－ dicular，and varying from one fuol to forty fuet in thickness．Tho small soins，which thoy aro now working，pay from $\$ 100$ to $\$ 300$ per ton．The 40 feot vein prospects，from threo diffurent runs of rock， 816,819 and $\$ 22$ to the ton，across the vein． The rock is blue，closo grained，and filled with grey sulphurets．The workers of the mines find it impossible to select the rock，as they would be as apt as not to seloct the poorest for the richest． Ono cannot see gold in the rock until after it is burnt，and little then．Men who are experienced in quartz jmining say it pays moro regularly than any rock they ever saw．Time and labor will de－ volop the permanency and extent of the mines there，and if they run deep and continue the same in richness and thickness，this will be the richest quartz district in the State．The veins are all close to permanent water privileges．There will be three mills in operation before spring，put up by the owners of veins here，and I think it is a splendid opportunity for a company to put up a mill to do custom work，as there are thousands of tons of good rock in sight．They are continually find－ ing new leads，which shows that there is still a good opportunity for prospectors．The prospects at Coso，from reliable authority，is really beyond the expectations of the most sanguine． at present．

No mor
Yacob．

## The Cary House，Placerville．

We present herewith an illustration of this first class and splendid hotel．This edifice was erected by Mr．W．M．Cary in 1857，and is eligibly situated on the corner of Main and Quartz streets．Eighty commodious，well ventilated，well

ighted and finely furnished apartments，with fine parlors， dining saloons and halls，are offered the traveling public．It is most centrally located，and adjoins Wells，Fargo \＆Co．＇s Express，and is near the Post Office．John W．Cullen is the most affable and accommodating of hotel proprietors． Stages and conveyances leave daily from this house to all parts of California and Nevada＇＇erritory．The greatest care and attention are shown to the patrons of the house，and we found the terms as reasonable as could be desired．

Curious Petrifaction．－The Panama Bulletin tells this curious story：
＂It will be recollected that about four years ago，Mrs． Kearney，wife of the late Mr．James Kearney，died in this city．Her husband，at that time being a merchant in As－ pinwall，had a zinc coffin made，in which she was placed，and also a quantity of alcohnl，the whole then imbedded in char－ coal，in a still larger coffin，for the purpose of preserving her， as it was her husband＇s intention to have her sent to Eng－
land ；but shortly afterward he took sick himself and oiel， land ；but shortly afterward he took sick himself and äiel， and also his child．The body then remained in the cemetery undisturbed，until a short time ago，instructions were re－
ceived from her relations in England，to have the body ex－ ceived from her relations in England，to have the body ex－ the body was found to be petrified and perfectly marble－like， but，strange to say，as quick as the air got to the body it clanged to a light copper color．＂
An egg was opened in Grass Valley recently，which con－ tained within its white portion a smalier egg，fully formed and with a shell on it．

Tue Indentrall School．－The Fourth Annual Report of the Board of Managers of this institution is before us $\mathrm{It}^{\prime}$ contains many features of interest to the citizens of this city as well as the State at large．There are ut the present time 52 imates，being an increase of 22 over last year，＂thus proving that the class of boys and girls for whose reforma－ tion the Industrial School was created，is numerous in our city．＂The causes of commitment are ：Leading au idle and dıssolute life， 40 ；petit larceny， 9 ；vagrancy， 2 ；grand lar－ ceny，1．That it is working well，it need only be mentioned that with the increase of 22 the expenses have been but little ahore the past year；and while the number of escupes was last year 16 ，this year they only amounted to 3 ．It seemis， also，that they have found the correct stimulant to encour－ age good beharior，that of rewarding the ohedient with con－ fulence．And we believe it is the experience of all teachers of the young that without confidonce in the pupils，success is impossible．
While we have schools for the man of letters，the mel－ chant，the navigator，and in some instances the agriculturist， none for the encouragement of scientific mining is on our coast，though of all countries here，where our main wealth is minerals，scientific mining instruction is most needed Why should we not have this branch taught to the growing up jouth？This，with the subject of industrial selfools should engage the attention of the instructors and support ers of the rising generation．
Reciamation of Swamp Land．－The Stockton Indepen－ dent says of Mr．Carpenter，à farmer in the swamp land of San Joaquin county：
He has been experimenting with levees and ditches for the last five years to protect his land from the annual overflow of the Calaveras，and finds it as necessary to have inside ditches or drains to carry off the rain water as to have levees or embankments to keep off the overflow．He runs his em－ bankments in straight and parallel lines－one through the centre and one on each side of his land subject to an over－ flow，and makes them three feet in lielght by twenty feet in
base．These embankments are used as roads in wet weather when the surrounding ground is boggy and impassable for When the
horses．
Mr．

Mr．C．eays the water will find its way，to some extent through the oldest and best levees，and that hew levees are of but little use the first year．It requires immense labor and patient industry to reclain the low，flat land on the lower end of the Calaveras ；but Mr．Uarpenter is not only setting a good example to the owners of such fields by the exercise of good judgment in bringing it under tillage，but is laying the foundation of an independent fortune．

A certificate of incorporation for the Banner G． \＆S．Mining Company was filed last week in the office of the County Clerk．Its object is to conduct the business of mining on a certain vein or ledge known by the name of the Last Chance Hill Vein， and located in the Esmeralda mining district．Its
Trustees are－Jobn W．Tucker，Gardner W．Case， Trustees are－Jobn W．Tucker，Gardner W．Case，
A．F．Mitchell，George W．Funk and Henry How－ ard Welch．The term of existence is placed at 50 years，and its capital stock at $\$ 800,000$ ，divided into 2,000 shares．

## Regarding Patents．

We desire to call the attention of all those who intend applying for Patents，to our superior facilities for obtaining the same．Our arrangements are such that we can have all the papers prepared，transmitted and returned，with the Patent Right，in three months from the time the applicant places the matter into our hands；thus saving at least three months delay．
The expense to the applicant would be rather less，if the business be done by us，than if the papers were sent to New York or Washington．
Thus by patronizing a home institution，our inventive itizens can save both time and money．
We have prompt，intelligent and reliable agents in the city of Washington who attend punctually to all Patent business sent to them．We have agents，also，at London， Paris，Brussels，Hamburg，St．Petersburg，Berlin，Vienna， and other European capitals．
We have also now associated with usin our business Wm．H．R．Wood，Esq．，whose well known legal acquire－ ments，and practical care，punctuality and correctness，emi－ nently qualify him for business of this kind．Dr．Wood also acts as general agent for all persons having business to be attended to either in this city or Washington city．

Hunter＇s Ghain Separator．－We saw this new invention in operation last week，and it performs the work in a thorough manner．It is calculated for separating any kind of grain，but is more espe－ cially adapted for wheat．The wheat to bo cleaned on this occasion contained a large quantity of oats and chaff；and after passing it through this ma－ chine it was quite clean．The grain to be cleaned top，and from thence passes down two inclined planes which are moved with a uniform notion from side to side by a crank．The upper plane has four compartments，one over the other，which are pierced with boles．The oats and barley in the wheat pass off into a box at the further end； and the wheat and chaff comes down in front－the good clean，wheat falling into one box，and the small stunted grains and chaff into another．Bags are hooked under these boxes，and as soon as filled are taken away and supplied by others．There is no waste in the operation． 600 sacks of wheat can be cleaned in a day by the large machine which is now in operation．Mr．Hunter is now building separators of a convenient size for farmers＇use which will cost $\$ 100$－and we could see that it will be a very useful machine for them．Every farmer is anxious to bring his wheat to market as clean as possible，for the price he will get for it will be in proportion thereto．By this machine he is ena－ bled to bring not only a clean article，but a good article，for it will have none but the good plump grains．The imperfect and broken grains and chaff make excellent chicken feed；or ground，it is considered equal to barley for horses．It is a Cal－ ifornia invention，devised by a practical farmer， and was patented in 1861.

## Gird＇s Budding Kuife．

This invention is one of the many Californie has thus far produced，and is certuinly deserving of her，it being the most useful and practicable for the purposes designed．The hor－ ticulturist who once adopts this knife will find its value so evident that ever after its services will be indispensable， since with it much labor and expense are saved．In speak－ ing of it the Scientific American says：

The above engraving illustrates a knife which is calcu－ lated to facilitate materially the process of budding．Upon the ends of the blades are formed crescent－shaped crosses of steel with fine edgee for cutting the T－shaped shtitin the bark of the tree to be budded．These blades with their crosses are made of different－sizes，so that some one of the three may be adapted to the size of the tree to be operated upon．

It is the practice of some horticulturists to remove the bit of wood which is cut from the scion with the bud，and to insert the bark only with the bud．To save this operation， the round blade is formed with several curves in its edge，so the round blade the formed with several curves in its edge，so off the bit of wood，the curves being of differest radii to adapt them to scions of different sizes．

With this knife several operations are reduced to one， and the process of budding is greatly facilitated．The cres－ cent－shaped cross is pressed through the bark making the cent－shaped cross is then by simply carrying the knife down， transverse cut，and then by simply carrying the knife down，
the vertical slit is made，and the bark is raised at the same time ready to receive the bud．This knife was used in Cal－ ifornia during the last season，for budding several thousand trees，and it gave great satisfaction to the operators．＂
Those desiring to purchase will please address Julius Sil－ versmith，San Francisco，respecting terms，\＆c．
Stock and Exchange Board．－A regular Stock Brokers＇Board，upon the same general plan as those of the older cities of the Eastern States，has been formed in this city．The necessity for such an organization in San Francisco at present，does not seem to be very urgent，but the rapid increase of stock companies warrants the belief that the stock brokers may have enough to do hereafter． The officers of the Board are：J．B．E．Cavalier， President ；E．W．Teackle，Vice President ；Frank－ lin Lawton，Secretary；Henry Schmidell，Trea－ surer－－Call．
The Desenet News states that a cotton mill has been built at Parowan in that Territory，and that some of the ma－ chinery has been put up and is now running．A considera－ ble quantity of cotton is now raised in southern Utah，and it is for its manufacture into cloth that this factory has been

## OUR MINES．

We have tried in vain to find out how our mines are paying．＇Tis no use，our miners won＇t tell．－ San Juan Press．
This conduct has ever characterized California， and may continue for an indeinite period hereaf－ ter，until the Government shall enact laws for col－ lecting revenue from mining sources．Though we are far from advocating such a moasure，yet we cannot with due deference to our almost impor－ erished Government，withhold the fact that many are now taking out their thousands from placer mines，\＆c．，without paying an adequate proportion of the taxes，as compared with the trader and me－ chanic．We should not be surprised to learn when Congress convenes in 1863，that an effort will be mado to pass laws for the sale of mineral lands，to－ gether with enactments for the better，more per－ manent and successful prosecution of mining．The attempt was made at the last session，but was de－ feated．Many will howl and complain；and yet we are of opinion that the advantages resulting from such a measure will prove of incalculable ben－ ofit to the Pacigc States and the Federal Govern－ ment．At present，some 80,000 miners in this State pay but a small tax，comparatively speaking． Should the Gevernment undertalse to dispose of the mineral as it does the tule and agricultural lands，an immense amount of revenue would be realized at once．The mining population would then remain permanently on their claims；gold fevers and excitements of that nature，would be far from swaying them from their homes；they would contrive to work their claims in a systemat－ ic way，with a view to permanency and economy． The mining claims in Nevada county are rich，and the owners thereof have no plausible reason for withholding their yields．If we desired，we could easily obtain the aggregate amounts realized by means which they could not ovade ；and as it is，we get the semi－annual amounts through the mint．But from which particular locality the sev－ eral doposits come from，may for a time remain sealed to the public．
On the other hand，if the Government should conclude to hold the mineral lands，and instead thereof tax miners pro rata of what they extract from their respective claims，the results of the amounts extracted would bocome generally known at once，and the true richness of our golden land proclaimed．Commissioners and overseers ap－ pointed by Government would soe to it that the daily or weekly results are marked down．Besides sucb enactmonts，strikgent laws governing mining will accompany，having especial reference to the construction of tunnels，shafts，levels，\＆c．，and ac cidents resulting from carelessness in these matters shall be severely punished，by fine or imprison．
ment．If we are not in favor of taxing ininers，we are certainly in favor and would strongly advocate a systematic mode for prosecuting mining in this State．Other evils would in turn be reached by means of such enactments．

## OUR LATE REVERSES．

A humiliating spectacle for a protud and powerful people are the late reverses the Union armies bave met with in the South．They are enough to make a loyal man＇s cheek color with shame，and droop his head in sorrow．An army of rebels，in the main not mach more than half our numbers， and not near as well appointed，have not only driven us from the territory they claim as theirs，bat have advanced into the loyal States，and threaten our very Capital！Truly， it is＂carrying the war into Africa．＂It is useless to try to hide or overlook the fact－we have met the enemy and－ they have defeated us；and，to highten our mortification，we have not even the poor consolation of an excuse to offer in palliation－we must quaff the bitter cup without anything to mollify its severity．We have had a year and a half to recruit and discipline our forces－time which，we were told， was being improved；we exultingly adranced to the very trenches of the rebels，and only waited for favorable weather to attack and capture them．But instead of at－ tacking we were attacked，and instead of capturing we came nigh being captured，and were compelled to make an inglo－ rious retreat．That those at the helm of state are responsi－ ble for these disasters，no one conversant with the history of the past year will deny．The loval States，with unparalleled promptness and enthusiasm，responded to all the calls Gov－ erument made upon them ：they fumished money by millions and provided and equipped an army such as，in point of numbers and persunnel，has not been equalled by any one nation since the great Napoleon＇s invasion of Russia．And after all this outlay of life and treasure，to be beaten by an army confessedly inferior in point of numbers，who are labor－ ing under the conviction that they are fighting against the regularly constituted authorities－shows that there is culpa－ ble imbecility or gross mismanagement in the Administra tion．

Our soldiers are as good stuff and as brave men as tread the earth，composed as they are of the acknowledged bravest peoples in the world－Americans，Irish，Germans，\＆c．－and carry with them the moral force of knowing that they are in the cause of right and order．But they have－been given for officers men whose peculiar acquirements and experience in no manner fitted them for military leaders；men who know not enough of military science to manceurre a regiment on parade，let，alone lead an army into battle．And this was done not for lack of tried and able officers，（for many such we have，）but through execrable favoritism．＇THs true there are many honorable exceptions；but these latter were so shackled and their powers so limited，that they were un－ able to accomplish anything．

Our late misfortunes，however，have，we hope，awakened those at the head of the nation to a sense of their folly；and， if they wish the loyal masses to still retain a hope of seeing the authority of the Government established over the $8 e^{-}$ ceded States，they will bury personal jealousies，and recon－ struct the army in such a manner as will be likely to win the gratatude of our own and the respect of foreign nations． In a word，put soldiers at its head，and send home the politicians to attend their caucuses．And for the honor of the country，let us have done with this wrangling and indecision：do not be perpetually changing，remov－ ing and appointing－tearing down to－day what was built yesterday；for nations，like armies，are almost certain to become disaffected when the rulers show their incapacity to govern．
If these be done，instead of rebel hordes desecrating the loyal soil of Pennsylvania，in less than twelve months that sacred emblem of liberty，the beacon of the oppressed， the hope of the suffering patriot－the glorious Stars and Stripes，will not only float over Richmond，but over every fort and citadel in the South．
San Francisoo，Sept． 13.
Military Election．－On Saturday evening last，the Franklin Light Infantry elected D．M．Greene First Liell tenant，vice Stuart，resigned；and John T．Barry senior

## OUR INDIAN TROUBLES．

From various parts of the mining regions of the State aco counts are daily coming to us of the hostile attitude of the natives．Such a condition of things exercises a very inju－ rious influence on the productive industry of the country， Surely the difficulties，toils and hardships with which our mining population have to contend are sufficiently onerous， without adding thereto these continual apprehensions of the tomahawk and scalping－knife of the savage．
What are our namerous soldiery about，that some of them are not made to operate in this direction？We have now lying idle，in different parts of the State，sotne five or siz thousand military characters，who，so far as we can learn， have never jet－though they have been mustered into the service over a year and living upon Uncle Sam＇s＂pap＂all the tume－been called upon to perform the slightest active duty．A little exercise，we have no doubt，would not ouly be beneficial but very grateful to them；and certainly such exertion could not be directed to a more useful or humane purpose than that of terminating these Indian difficulties．

This has to be done either by the General Government or of the State and private enterprise．If accomplished by the former，they thereby save all the expense which will be at－ tendant on fitting out an expedition by the，State．Chis State has already large claims against the National Govetn－ ment for expedilures incurred in suppressing Indian hostili－ ties；and it is certainly not desirable that these clajms should be increased．It is well known that the General Gov－ ernment is responsible for all the expences necessarily in－ curred for purposes of this kind，as it has on various occa－ sions heretofore recognized．Why，then，when it has the men already under pay，and lying in idleness，could not the Government employ them in this way，temporarily，and thus save the expeuse of baviog these hostilities suppressed by the State．They could thus be more promptly as well as more effectually put down；whilst，at the same time，such a course would at once withdraw from those anprincipled whites，who are said purposely to excite these wars，all temptation and inducement to prosecute their unholy schemes；for if these hostilities are thus designedly excited by bad men of our own race，it is only with an eye to some future charges for mili－ tary services，that they may＂feather their own nest＂at the expense of the public treasury．
The Government could scarcely offer a more direct reward for getting up these Indian wars than by leaving them to be dealt with by the very men who produce them，and then pay－ ing the expenses out of the general treasury．If，however， instead of allowing them to be put down by private or State enterprise，the Government would，whenever they occur，send their own troops to suppress them，and call the guilty perpe－ trators of the first wrong to stern account，it would be ren－ dered impracticable to make them a matter of speculation by private adventurers．The United States troops now in California are doing nothing，and where is the excuse for thus allowing our most productive citizens to be driven from their homes and avocations by these Iudian outbreaks？why not reduce them at once to subjection and place them on the reservations for civilization？
The present is too critical a juncture in our financial af－ fairs，to permit the gold－bearing regions of Californa to be rendered thus useless and unproductive．It is almost alone upon the basis of the gold and silver mines of this coast that our present exorbitantly expanded paper currency must fiod a support－and every contraction of the field or diminution of the amount of their production，，most sensibly affects the wide circumference of the country．It is gold and silver alone that supplies the solid circulating medium of a coun－ try，and hence the Government is loudly invoked to see to it that the free and unembarrassed working of the mines of these precious metals is not interfered with in the slightest degree．We，therefore，call upon the military authorities of this coast to put down at once and forever these eternal and ever periodically returning Indian hostilities，and allow our hardy and industrious miners to pursue their vocations，at present so indispensable to the vitality of trade the prosperity of commerce and the general well being of the nation．They may thus render as great，or greater，service to the country than if they should meet and conquer the bannered foe upon the plains of civil war．

Will not the military commandant on this coast act on this suggestion，and thus save the national treasury at least two or three hundred thousaad dollars？Don＇t say you have two or three handred thousaud dollars？ not got the power ；take the responsibility．

A CHAPTER TO INVEMTORS AND DISCOVERERS.
The whole community is benefitted by the promotion of the nseful arts, and, therefore, it is for the public good to hold out the promise of rowards to the inventors of new and useful arts and manufactures, who may first put the public in possession of them. It is true that by such a grunt as a patont makes-a monopoly for a time-every other person is restrained during the continuance of the monopoly from using the invention, even if ho makes a similar discovery himself. But at the time the grant is made, it is by no means certaiu that the invention will be given to the public, or evon made bj any other person; and by the temporary suspension of their right, the people acquire the certainty of being able to use the invention at tho expiration of the monopoly. Utility to the public is, in fact, the consideration of every grant for the sole ase of an invention, and letters-patent containiog such grants always state tho public good to bo the motive in making the grant.

Hence, therefore, the total absence of utility to the public, in any invention, will at all times vitiate a grant of the sole use of it. But it will not be void on that ground if it were useful to the public, although such utility may be very small.

But an incention may be of some use to the public, and jet be so trifling or frivolous, that the inconvenience arising from a grant of the solo use of it would not be adequately compensated by the benefit which the public would receive from it. The law, therefore, has deemed it right that mere discovery of any new manufacture shall not vest the sole right to use it in the inventor; but that to be entitled to such privilege be must obtain a grant from the Government, who have the right of judging, not only whelher the invention is likely to be of sufficient utility to warrant its being made a matter of public concera, but also the duration of the privilege it merits.
. There is reason to believe, though it, is not positively known, that the practice of making grants of the sole use of inventions originated in England, and that it has thence been copied more or less closely by other nations. It is a power derived from the common law of England; and this law has been modified by statute in modern times $b$, th in England and other countries. (Hindmarch on Patents, 3.)

No person can be the grantee of a privilege in an invention except the true and first inventor. To be capable of supporting such a grant tho patentee must be the person who has not only actually invented or imported the invention, but who has been the first to give it to the public.

In England it is held that the first importer of an invention from abroad may have a patent. (Edgeberry vs. Stephen, 2 Salk., 447; Dav. P. C. 36.) This, however, is not the case in the United States. Here the inventor alone can get a patent. He is deemed the first inventor who first gives, or contracts by patent to give, a knowledge of it to the public. And the fact of first introducing an invention is prima facie proof of first invention. Although a patenteo's claim to be the first inventor will not be defeated by the prior discovery of the same thing by one who kept it secret, yet it is otherwise if the invention was known to be used by the public at any time before the date of the patent.

If the inventor himself publishes a knowledge of it, the law deems that he thereby dedicates it to the public; and when once the publication has
boen mado tho act is irrovocable, and a patent cannot be granted, or if granted will bo useloss. And if the public becomes possessed of a knowlodge of it by any means whatevor, no patent can bo granted.

## bad management in miving.

Our recent tour towards the Sierra Nevada has afforded us an opportunity of seeing considerablo mining enterprises, which from their simplicity and primitive modes, hardly entitles them to be called enterprises. The placer mines throughout California, it must be assumed, have scarcely began to be worked, although something like $\$ 600,000,000$ have been extracted since the year 1848, and countless millions are jet concoaled in the hill sides and mountains on both sides of the Sierras. Thus far only a scraping in the ravines and gulches has been the extent of mining, and when these had beon worked once or twice (some of which would even now pay from $\$ 3$ to $\$ 10$ per day to the hand), are declared "worked out"-despite after the periodical rainy seasons, when the same will, as before, pay excellent wages, which proves that the hillsides are yet pregaant with fine particles of gold. In our tour from Folsom to Placerville, we noticed many places abandoned on account of the want of water, and little, if any, worls was being done to prepare for the coming rainy season. We noticed but one ditch company, but their rates are held so high. as to preclude many from mining, unless their claims are extraordinarily rich.

The old mode of sluices and toms are still in rogue in this district. The current in the sluices is generally so great as to carry with it the fine atoms or scales in its course; only the heavier particles or grains of metal precipitate. The miners in and about El Dorado county seem not to have taken advantage of "Dunning's under-current sluice," as described in the Miners' Companion and GUIDe. If reconrse were had to this invention, together with increasing the width of the sluices and drifting the hillsides in every direction, from 15 to 20 per cent. more gold would be saved.

Though quartz veins abound in the vicinity of Plarerville, yet little onterprise is boing evinced to work them for their metallic wealth. One establishment only seems to be profitably engaged in reducing a moderately good paying lead, which renders on an average $\$ 15$ per ton in gold. It is owned by parties formerly of Nevada county, and is known as the Pacific Quartz Mill. Some fifteen members form this company, many of whom are practical miners, having worked in the Lake Superior copper mines. The reducing works are of an improved plan, being a 20 -slamp Bryan's mill, 30 -borse power engine, and utensils for working sulphurets.

A large field is still open in Placer and El Dorado counties for mining, and we see no reason why the complaining white man in these sections should allow the miserable Mongolian to quietly go to work and extract the precious metals from under his nose. The coolie, with his simple means, takes out enough to pay an enormous tax, besides onriching himself in a fow years, even after the claims have been worked several times over. It is equally astonishing to see that the municipalities, town corporations, or enterprising citizens in mountain towns, do not take advantage of making the coolies subservient to their interests; namely: these coolies are under the immediate surveillance and superintendence of companies in San Francisco, who have established agencies all over California, espe-
cially where mining is carried on, and the results of their labor and industry, with but few excoptions, go towards enriching those opulent mandarines. Now, every corporation or private company throughout California, might take up and prospect mining ground by hiring from mandarin companies their nominal slaves or coolies, who may be had in numbers at from $\$ 15$ to $\$ 20$ per month per capita. Sooner or later the laws regulating the Chinese tax must and will be so modified as to preclude them. from our mines, except when employed by white persons or companies. Aside from mining pursuits, their services might be profitably omployed in the construction of ditches, canals and roads-these latter, by the way, are wofully neglected. The present rates of wages are too high, ranging from $\$ 250$ to $\$ 3$ per day, and scarce even at this.

Altogether, the districts which we visited show lack of enterprise and judgment. The roads, with fow exceptions, are, for this season of the year, in sad plight, and if we had authority over the road overseers, we should condemn them to be hung for neglect of duty.

## URGENT NECESSITT.

The impending session of the Legislature will have to pass a law and provido funds for the establishment of a State school, in which the sereral sciences belonging to geology, mineralogy, chemistry, metallurgy and mining engineering will be taught by able professors. The expenses necessary for such purpose can easily be defrayed by imposing a small tax upon the 80,000 miners now employed in our mines, and these will willingly further the ends for such an institution. The want of such a school has long been felt, for many reasons, and we have hundreds of young men who would willingly pay for their tuition in these branches. Aside from the benefits which the poorer class of students would receive, and who are oither physically or mentally incapable for other occupations, when graduated students, have left the institute, they can be useful to themselves and the community at large, and their services in developing our mineral riches will more than com. pensate for the outlays of the State. The majority of our miners are devoid of the necoessary knowl-
edge in mining for the precious metals, and the greater part of them only know how to traffic in "paper stock." The State oabinet of minerals should at once be placed at the disposition of the school, and analyses of all the specimens should be made. The several scientific associations will, we are satisfied, render every aid to such a school. We are little known abroad for our mineral wealth, because we do nothing for the permanent and systematic prosecution of miuing operations. Gentlemen Legislators, your predecessors have been noted for squandering the hard-earned monies of your constituents; do you abrogate this pornicious practice, and give us a first class mining school, with a salaried professor for each branch, thereby you will merit the blessings and thanks of a grateful people, who are now groping in darkness while in search for the needy.

On Dir.-It is rumored about town that a new scientific and mining journal is to appear. If the parties were only aware of the up-hill work attendant on the building up of such a journal, unless they have about $\$ 20,000$ to invest without the shadow of return, they would keep their fingers out of the pan. The Mining And Scientific Press is too well established and sufficiently ample in furnishing the mining community with instructive reading matter. We have not made any money yet, and we cannot see how a new comer can supersede us in this particular.

## WHY WILL YOU SUFFER, YOU THAT ARE AFFLICTED?

DISEASES CURED WITHOUT 'THE USE OF MEDICINES!

THE DIRECTORS OF
The Electropathic Institute,
Offer those who would avail themselves of the researches into the arena of medical science, an opportunity to benefit thereby. Thus, by the application of an art totally differing from the usual routine systems of the day, Electropathy is now the favorite study and practice of the most learned medical savans throughout continental Europe. Every proof exists that the magnetic electro current reaches directly the nervous centres, the brain, spinal cord and nerves of sensibility and motion, the controlling agents of organic life. The application of this powerful and mysterious agent is thus made, uoder the guiding hand of experience, subservient to the alleviation of disease, restoring through the medium of the nervous system the normal functions of the various viscera. By this agent the pernicious consequences of converting that most delicate of organic tissues, the stomach, into a chemical laboratory or drug shop, is totally avoided. Thousands can testify as to its efficacy, and many have experienced its beneficial effects. When correctly administered, Electropathy is applicable to all diseases to which flesh is heir, but more particularly to complaints of the nervous system, Rheumatism, diseases of the Lunge and Spine.
The Directors have secured the services of Dr. JOSSELYN, whose improved Electropathic Instrument stands in advance of all others as a curative agent. This scientific Physician will be in attendance from 9 A. M. until 8 P. M., to consult with the afficted, and in all cases where he can conscientiously do so he will warrant a perfect and permanent cure. Those particularly who have exhausted the catalogue of medicines, will do well to call and consult him, and examine the certificates of cure which he has recorded in the Institute.

The above troublesome disease can be cured by electricity only; and Dr. Joselyn of the Electropathic Institute will warrant a cure, perfect and permanent, in a very short time, or ask no pay for his services.

## Consumption,

That awful and hitherto considered incurable disease, can be cured by the Electro-Maguetic treatment. The Electropathic treatment at once stops the ravages of this fell destroyer, and the cure commences from the first treatment. A cure in aill cases will be insured.

## Diseases of the Eye.

The Electric treatment is the only mode by which a rapid and permanent cure can be effected in Sore Eyes. It acts upon the nerves and mucous membrane connected with the eye, and the removal of morbid matter and all inflammation, produces a healthy action, at once restoring that va'uable organ to its natural state. A cure warranted, or no pay asked.

## Electro-Magnctic Baths.

Connected with this system are the renowned ElectroMagnetic Baths. Here let us caution the public against the numerous inpositions in the bathing line. The pure magnetic bath is one of the most effective aids in the removal of disease from the system, but if given at the wrong time is likely to aggravate trouble ; and cases have been known where the patient has been injured so badly as to require months to remove the injury. The only place where these baths can be obtained in all their purity is at the Institnte, where the resident physician will be always ready to examine and see that they are not unseasonably administered, and if not necessary, advise the requisite remedy.

Below will be found a list of the cases which have been successfuly treated by the Electropathic System, at the Intitute, during the last year:

## PACIFIO <br> PATENT AGEICI <br> JULIUS SILVERSMITH SOLICITOR.

Office...... State Capitol,
Nos 23 and $24, \mathrm{Up}$-Stairs,
Oornor of BATTERY and WASHINGTON STS. SAN FRANCISCO, CAL.

PATENT LAW AMENDMENT OF 1861.

The Patent Law Amendment Act, passed March 4th:1861, and uow in force, intruduces several important changes in our Patent System. The general practice of the Patent Office, bowever, io regard to the examination and issue of Letters Patent for new inventions, remains nearly the same as heretofore.

The first question, therefore, that presents itself to the inventor, who desires to procure a patent, is : "Can I ubtaio a patent $9^{" \text { A positive answer to this question is oulg to be }}$ bad by presenting a formal applicatiou lur pateat to the Guvernment, embracing a petition, specification, model, duplicate, drawings, and the paymeut of the prescribed official fees. Aside from these steps, all the inventor can do is, to
sabmit his plans to persons experieuced in the business of obtaining patents, aud sulicit their opinion and advice. If the parties consulted are honorable men, the inventor may safely confide his ideas to them, and they will inform him whether or aot his invention is probably patentable.

Those who bsve made inventions sad desire to consult With us respecting the same, are cordially
We shall bu bappy to see them io person at our office, or to advise them by mail, or through the Mining and Scientifio Press. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice, we make
no charge. A pen and-ink sketch, and description of the inno charge. A peu andink sketch, and description of the inpostage. Write plain; do not use peucil or pale ink; be

Remember that all business committed to our care, and all consultations, are kept by us secret, and strictly confidential.

## PRELIMINARY EXAMINATIONS.

In some cases it may be advisable as a measure of prudence to order a preliminary examination. This consists of a special search, made at the U.S. Patent Olfice, Washington, through the medium of our assuciate in that city, to ascertan Whether among all the patents and models there stored, any invention can be found which is similar in character to that
of the applicant. On the completion of this special search of the applicant, On the completion of this special search
we send a written report to the party concerned, with suitable advice. Our charge for this service, including the report, is ten dollara. This search, though it involves the expense just named, will usually prove satisfactory. If the same deFice bas been betore patented, the time and expense of con-
structing models, preparing documents, etc., will in most cases be saved; if the invention has been in part patented, the applicant will be enabled to modify his claims and ex pectations accordingly. Many other obvious advantages atsearch does not always eaable the applicant to know posi tively whether a patent can be had. Applications for patents are often rejected because the Examining officer finds a description of the alleged invention in some foreign publicatiou; or some other person has been previously rejected on an analagous device; or some otber invention for a similar purpose, but partially resembles the applicant's in its conetruction; or the Goverament makes an unjust or uncommon decision. Against none of these contingeucies does the Pre-
limioary Examination provide ; it will, however, generally limioary Examination provide ; it will, however, geberally
infurm ite applicant whether an improvement similar to his, and used for the same.purpose bas ever been patented or not in this country.

Parties desiring the Prelimipary Examination are requested to remit the fee ( $\$ 10$ ), and furnish us with a sketch and description of the invertion.

## caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a neriod of one year, of any judged to be novel, and is likeiy to interfese with the inven-
to complete his application for a patent within three monthe From the date of said notice. Cuveat papers should be very carefully prepared. Our fee for this service varies from fiftern to twenty dollars. The Goverament fee under the new law is reduced to ten dollars; and this sum does not apply, as beretofure, as part of the fee on presenting an application for a patent.
Inventors will oftimes find it very important to take advantage of the caveat system-the expense under the law be ing comparatively emali.
To enable us to prepare caveat paper, wo only require a sketch and description of the invention; no model being aeceasary.
EXPENSE OF APPLYING FOR A PATENT, RE-

## JECTIONS, ETC.

Under the new law, the Government fee, on filing an applicution for a patent, is fifteen dollurs; and if the patent is allowed, tweuty hollars additional is required. If rejeeted,
the first fee of fifteen dollars is all that is demanded. Englisb, French, Austrian, Prussian, Spanisb, and inventors of every nationality, may now obtain patents in the Uuited States upon the same terms as our own citizens. The only discrimination made is against subjects of governments that discriminate aguinst the inhabitanus of the United States.
To the foregring ufficial fees must be added the Attorney's
fees for preparing the various documents and drawings. Our charge lor preparing a case, presenting it to the Guvernment, and attending to all business connected with it, until a decision is given, is generally forty dollars; but the charge is higher if unusual labor is involved. If the patent is granted no further ageney expenses ensues. If the application is
rejected we cause a thorough investigation to be made into rejected we cause a thorough investigation to be made into
the reasuns presented by the Commissioner for refusing the patent. Is makiog this examination, we have access to all the drawiurs, models, books and specifications cited in reference, and we report the result as easly as possible to our chenl. For this service we make no charge. If the rejec -it cangenerally be reversed, and tha patent obtained by contesting the cuse. Fur this prosecution we cbarge a fee proportionate to the extra labor invulved, payable only on the issue of the pateut; but our demand will be reasocable and satisfactory to our clients, and will be arranged belore band by special agreement.
Genkral Remaris. -
Genrral Remaris.-For the information of applicazts We would state that some agents are in the habit of cbarg-
ing for the preparation of the case, and having no further cilities, decline all investigation or prosecution when rejected Others, also, having no facilities of their own, advise their clients to go to the expense of procuring official copies of the drawings und specifications ol all the relerences. Again otbers are in the babit $\mathrm{o}^{\text {. }}$ charging a bigh price at the outset, in which they include the cost of prosecuting the case, it by them deemed necessary. Under this system, if the patent is sues, or is justly rejected, no further prosecution is needed but the inventor has paid full price for a service not wanted and never rendered.
Uur object in makicg the above statement is, not to reflect "pon the manner in which olher agents conduct their affairs but simply to have our own method of doing business clearly understood.
The system adopted by us works well, gives general satisfaction, and presents to all applicants, rich or poor, an equal opportunity of baviog their patent cases prepared, conducted
and prosecuted in the best manner, by experienced attorneys, upon the most modurate terms. Inventors who have rejected cases, prepared either by themselves, or for theio by other agents, and desire to ascertain their prospects of success by further effurts, are invited to avail themselves of our unequaled facilities in securing favorable resulto. We bave been suc cessful in securing Letters Patent in hundreds of such cases. Our terms for such cases are very moderate.

## MODELS, REMITTANCES, ETC.

The law requires that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of
its dimensions ; it should be neatly made, of hard wood or its dimensions; it should be neatly made, of hard wood or metal, or botb, varaisked or painted ; the nsme of the
tor should be engraved or painted on it conspicuously.
Where the invention consists of an improvement on some
known machine, a full working model of the whole will not known machine, a full working model of the whole will not
be necessary. It should be sufficiently perfect, however, to be necessary. It should be sufficiently perfect, however, to
show, with clearness, the nature and operation of the invention.
As soon as the model is ready, it sbould be carefully boxed and shipped by express or other $\pi$ ise, to our address, namely, J. Silversmith, lale state Capitol, Rooms 23 and 24, San
Francisco. Prepay the expense, and send express receipt to us by mail.
Simultaneously with the model, the inventor should also seud us the first instailment of the Goverbment fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way to remit is by draft on San Francisco payable to our order. Always send a let-
ter with the model, and also with the remittance, stating the name and address of the sender. We sometimes receive ejvelopes containing money, but withont any name or explanation; m
sources.
A fall description should also be sent with the model, em-
boriging all the ideas of the iuventor respecting the improp ment.
On the reception of model and Government fee, the case is duly regiatered upan our books, and the application proceed. ed with as fnat as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature, and athiduvit, with a letter of instruction, etc. Our fee for preparing the case is then due, and will be called for. The case will then be presented to the Patent Office,and as soon as the patent is ordered to be issued, the applicant will be notified to remit the last installment of the Government fee, namely twenty dollars.
Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal at-
tendance of the inventor, unless the iovention is one of great complication ; the business can as well be done by correspondence.

When the invention consists of a new article of manufacture, or a new compersition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufretured article itself, must be furnished.
The average time requird to procure a patent, when the case is conducted at our agency, is three montbs. We frequently get them through in leas time; but in other cases, owing to delay on the part of officials, the period is sometimes extended to four or five montbs, aod even more. We make a special point to forward our cases as rapidly as possible.

## RETURN OF MODELS.

Under the new law, if the applicant's case has been rejected he is entitled to withdraw his model from the Patent Office. This law applies also to all past rejected cases, and if parties wish to obtain their models through us, they can do so at a small expeose.

## DESIGNS, TRADE-MARKS, LABELS, ETC

Under the new law patents mav be taken out for any new form of any article, also for tools, patterns, castings, machineframes, stove-plates, borders, fringes, all new designs for printing, weaving, or stamping upon silks, calicoes, carpets, marks, labels, envelopes, boxes and bottles for goods, may also be patented ; lisewise all works of art, including prints, paintings, busts, statues, bas-relief, or compositions in alto, or basso relievo, new dies, impressions, ornaments to be
placed upon any article of manufacture, architectural work, placed upon any article of mannfacture, architectural work, according to the fee paid by the applicant, as follows

Patent for 31/2 years.
No models are required. But duplicate drawings must be furnished, together with the usual specification, petition and affilavits, which, to render the patent of value, should bo prepared with the litmost care.
Our facilities for the prompt preparation and securing of patents are of the most extensive character and our charges are very moderate.

## INFRINGEMENTS.

The manufacture, sale, or use of a patented article, without consent of the owner of the patent, is an infringement, and subjects the infringer, by injunction from the Court, to an arrest of or probibition from the employment of his machinery, shop, works, factory, and men in production of the In addition to injunction the infringer is liable to be mulched in treble the amount of damages awarded by the jury. The maker, the workman, the seller, and the purchaser, if a user, are all liable, either collectively or individually.
Having access to all the patents, models, public records, drawings, and other documents pertaining to the Patent Of fice, we are prepared to malse examinations and give opinions upon all infringement questions, advise as to the soope and ground covered by patents, and direct with vigor any legal proceedings therewith connected. Our charge will be moderate, and proportionate to the labor involved.

Address all lettere of inquiry to J. Silversmith, State Capitol rooms 23 \& 24, San Francisco.

## APPEALS.

In rejected and othr cases, the new law provides for an appeal from the Examiner-in-chief to the Commissioner in person, on the payment of a fee of twenty dollars. A further appeal may be taken from the decision of the Commissinger to the U. S. Oourt, of the district of Columbia. These appeals are beard by any of the Judges before whom the applicant elects to bring the case. No Jury. All the papers, models, etc., are sent by the Commissioner to the Judge, who then reviews the case, and either sustains or reverses the Commissioner's decision.

The party taking the appeal pays an additional fee of twenty five dollars. The Judge appoints a day of hearing. The applicant can appear in person or by counsel to state his case and file a written argument. Five days are allowed the opponent to put in an answer, and a similar period to theap. pellant for a closing reply.

Many important cases are brought before the Judges on appenl, and the decisions of the Commissioner are not unfrequently reversed.
We have had successful experience in conducting these ap. peals and our services can be retained on moderate terms.

SUGGRSTIONS ABOUT FOREIGN PATENTS.
American inventors should bear in mind that, as a general rule, any invention which is valuable to the patentee in this country, is worth equally as much in England and some otber foreign countries. Four patents-American, Euglish,French and Belgian-will secure an inventor exclusive monoply to his discovery among one hundred millions of the most intelligent people in the world.

The facilities of business and steam communication are such, that patents can be obtained abroad almost as easy as at home. The majority of all patents taken out by Americans in foreign countries are obtained through the Mining and Scientrfic Press Patent Agency. Having established agencies at all the priocipal European seats of Govern ment, we obtain patents in Great Britain, France, Belgium, Prussia, Austria, Spain, ete., with promptness and dispatch.
Models are not required in any European country, but the utmost care and experience is necessary in the preparation of the specifications and drawingse
When parties intend to tak out foreign patents, engravingsshould not be published until the foreign applications have been made.

Cayrion.-It has become a somewhat common practice for agents located in England to send out circulars soliciting the patronage of American inventors. We caution the latter against heeding such applications as they mas otberwise fall into the hands of irresponsible parties, and thus be defrauded of their rights. It is much better for inventors to entrust their cases to the care of a competent, reliable agent at home.

While it is true of Most European conntries that the rystem of examination is not so rigid as that practiced in this country, yet it is vastly important that inventors should have their papers prepared only by the most competent solicitors in order that they may stand the test of a searching legal ex amination; as it is a common practice when a patentee finds 2 purchuser for bis invention, for the latter to cause such examination to be made before be will except the title.
It is also very unsafe to intrust a valuable invention to any other than a solicitor of known integrity and ability. Inventors should beware of speculators, whetber in the guise of patent agents or patent brokers, as they cannot ordinarily be trusted with valuable inventions.
A Circular containing further information, and a synopsis of the Patent Laws of various countries, will be furnisbed on application to J. Silversmith, Government House, San Francisco.

此豕Miners, Inventors, Agriculturalists, Capitalist and Mechanies, will find if to their advantage to subseribe for the Mining and Screntific Press-being the only journal of that elass published upon this continent. Issued every Saturday at four dollars per annum.

DR. HILIS'S IMPROYFD AMALGAMATOR AND GLEANER.
The accompanying illustration presents, Dr. Illl's im proved gleaser. fise which he ubtained letters patent January $1=6$, 1861 , ince which, several of these have bern practically emploged in several southern counties, in this State and Nevada Territory. We have in our office a working podel, which we have carefully $\varepsilon$ xamined and tested, and from careful observations concluded that it embodies all the natural principles and laws for doing that for which it is intended. Centrifural and centripital furces, form some of its leading and must interesting features: for its practicability and usefulness, we cheerfully rf fer to the certificutes hereby appended emanating as they do from honorable and reliable sources. Our illustration is a faithful sketrh; the simplicity of construction, and the manner of its operation, render it one of the most practical, useful and bighly scientific inventions in existence. The inventor says:
lst, That it is automatic in its workings, consequently more cconomical than a vessel requiring mantal aid; as with it and a mill of 12 stamps to crush and amalgamate, together with the services of an elficient feeder, twelve toms may be put thrnurh in as many hours: with a saving of 99 per cent. of the liberated gofl: and the same be cleaned up in one hour from the stoppage of the mi.l by one man, whether for a day's, week's or mouth's run.

1, It is a perfeet guardian apainst all such loses as result from overfeeding, over or under dosing a battery with nercrny: all of which are well known by practical millers to be productive of much waste.
3d, It superceles the uecessity of conpler plates whether inside or antside of the battery together with sluices, gunny bags, blankets, revolving barrels, and all their kindred contrivauces, together with the incidental expenses attendant upun the sane. It also dispenses with the toil of unhousing a battery, except in case of accident, or when gold is too coarse to pass the screens. So that the work requiring the services of three or funt persons all day, is uccomplished by one man in one hour, that being the extent of time required
to clean it, whether, as observed before, for a dlay's, week's, to clean it, whet
or month's run.

4th, It can be so arranged that no one, save those having the exclusive right, can interfere with it; a desideratum not to be dispised by mill proprictors.

The physical laws by which these results are arrived at are the following: specific gravity, centrifugal and centripital forces, aided by water.

The specifie gravity of gold is 19 ; mercury 13; quartz 2, about. Nuw it must be borue in mind that all bodies when immersed in water lose a portion of their weight equal to their bulk of water, consequently the relative weights of the above budies will be as follows, yold 18 ; mercury 12 ; quartz
1 about, showing a great prepondetance in the weights 1 about, showing a great preponderance in the weights

When the crushed material from tho mill arrives at the gleuner, an immediate separation of the amalgain from the accompanying waste matter takes place; the former from its superiority of weight descenning to the pool of mercury, becones incorporated with the same, and sinking to the bottom, remains as in a stationary vessel; while the waste matter or tailings, from their inferionity of weights, are held in suspension, and in this condition expelled frow the gleaner by the centrifugal force.

Should any of the amalgam in its descent escape the pool, it is at once seized by the mercuralized surlace of the vessel, when, from affinity and cohesion, it so firmly fixes
itself as to be proof 8 gainst any power at work in the vessel itself, as to be

The speed imparted to the gleaner is barely sufficient to expel the waste matter, and retain the good.

$$
\text { Anazis, April 19, } 1062 \text {. }
$$

Having thoroughly tested the mer ts of J. ML. Hill's gleaner, at the Broderick Mill, I unhesitatingly acknowledge its superiority over all other contrivauces of my knowing, for the collection of amalgam; as also for its economy in working. In proof of which I wuald state that after running it one week, in connection with the Mill, I had the hides which were placed below it and which were repeatedly washed every day in a tank, carefully panned out by an experieuced hand. The result of which did not exceed fifty cents; although milling at the time rock worth fifty dollars per ton.

San Franaisoo, April 23, 1862.
Dr. J. M. Hill, Angels Canlp-Dear Sir : I take much pleasure in testifying ta the value of the gleaner as an amalgamator. I consider it superior to any other machine now in use for saving gold, no natter to what state of division the same may be reduced.

Yours,
Edward A. Breed. ANGRLS, April 18, 1862.
Having subjected Dr. J. M. Hill's gleaner to a fair trial, at my mill. I can safely suy, that it is superior to anything in use, of which I have the knowledge, for the purpose intended, namely. the separation, and retention of amalgam, from crushed ores.
E. C. Winter.

## THE EYES! THE EYES!! THE EYES!!!

## DR. E. H. PARDEE,

Oculist and Aurist to the San Francisco Deaf, Dumb und Blind Asylum.

After a protracted blindness of more than five years, Dr . PARDriE has made himself thoroughly and scientifically acquainted with all diseases of the Eye, and is now practic-
ing with a success that cannot be surpassed in the United States; and as proof of this he substantiates by many cases now in Califormia that have been cured by him, after having exhausted the skill of the eminent physicians and oculists of New York city, Bostou and Philadelphia.
From an extensive practical knowledge of more than 14 years, Dr. Pardee asserts, and is prepared to prove, that there has been more bliudness from bad and improper treat ment than from disease itself-how can it be otherwise when we take into consideration the effects of the old hacknied course of local treatment that patients undergo-Caustic to-day and Bluestone to-morrow-more painful than death, and always more tedious than the disease. Patients are daily presenting themselves with chronic cases, and on inquiring what hud been formerly done, the almost invariable reply is, "I had my eyes burned with caustic or bluestone ; and bistered, theu cupped two of three tid wepk-had a blue pill prescribed for me at night, and salt: in the norning-was ordered in a dark room-to keep my eyes tightly bandaged-to avoid the open air and exercise," with fifty other inconsistencies, the aggregate of which is sure blindness. Patients should be careful and not place their eyes at the mercies of a man who does nothing but bura them daily, not investigating the circumstances of each particular case, but ignorantly and blindly adopting and folInwing theories the most erroneous, and destructive to the eye. How much more rational and consistent to consult an experienced Oculist, who thoroughly understands every disease of this tender organ in all its aspects and varieties. Dr. PARDEE has from sixty to one hundred patients under his daily supervision, and, with but very few cases, they have all been treated by other physicians hefore applying to him-and all to no benefit. 'I hose wio are doubtful are permitted to call at Dr. Pardee's office and confer with the many patients who couvene there between the hours of 9 and 12 in the forenoon. The Dr. has a large and only assortment of Artificial Eyes on this coast, inserted, having all the movements of the real eye, and that they lo k so life-like that no one can tell them, when properly inserted, frcm the real eye. These eyes are sold reasonable.
All the operations performed, such as "Strabismus," or cross-eyes-" Cataracts"-or removal of the Lens by absorption or extraction;-"Plerygium," or fleshy membranes growing over the eyes. Artificial Pupils, \&c.

MINING AND SCIENTIFIC PRESS.
THE ONLY MINING, MECHANICL AND SCTENTIFLC Paper on this continent.
SECOND YEAR: VOLUME IV.-NEW EERIES I
A uew rolume of this extensively circulated paper commonced March 30 1861. It is inteuded that every number shall be replete with information concerning Mining, Scientific, Mcclanical and Industrial pursuits, together
with several origiual engraviugs, of uew inventions, etc., prepared expressly
This paper is devoted to the above purposes, together with the interests of science, Arts, Agriculture and Commerce, nond any general information that may be of interest to the reader : and it is tho intention of the proprie-
tor to spare no pains or expeuse in making it equal in interest and valuablo tor to spare no pains or expeuse in making it equal in interest and valuablo information to any paper yet published.

The Mining Interest!
Will fud it of great ralue, as it will contain all the news apportaining to Mining, the prices and sales of Mining Stocks, new inventions of Machinery addap ecd to taat purpose, and of everythigg geueraly that may be of sorvice
to the Miner.
The Inventor!
Will find it an excellent medium for the purpnse of bringing his invention into ootice, of ascertaining the progress of invention in this and other
countries, and also of receiving any information that may be necessary countries and bisportent, the proprietor having had great experiences as a Patent Agent, together with facilhties at Washiugton that onable him to ob in Patents with dispatch.

The Mechanic and Manufacturer !
Will be greatly benefitted by ite perusal, as asch number will coatan eereral origioal enyravings of new machines and inventions, together with large amount of reading matter appertaiuing thereto. Wo are constantly
receiving the best scientifie journals from all puarters, from which we receiving the best scientific journals from all quarters, from which we
shall coutnue to extract whatover may be of benefit or interost to our
隹
readers.
To Chemists, Architects, Millwrights and Farmers I
This journal will be invaluable. All new discoveries in Chemistry will be given, and a large amount on fiormation or groat service as Alatects and
Hillwrights will be found in our columus. The Farmers and Planters will not bo neglected, engravings will be given of agricultural implements, and the farming interest generally will be amply discussed.

Our Mint, its Rules, Charges and Operations.
In the columas of a contemporary we observe some exceedngly interesting statistics of mint matters for many years past, from which we glean the facts that the legal limit of wastage was $\$ 207,76699$ for the three years ending April, 1857 , while the actual loss was $\$ 266,31286$, exceeding the limit some sixty thousand dollars. During the four years of Mr. Hempstead's Superintendency, the legal limit was $\$ 235,386$ 39; while the actual lost was only $\$ 4,52035$ being some $\$ 230,000$ less than the limit, and, in fact, 2 little under two per cent. of the amount allowed by law to be wasted. The wastage of the Philadelphia mint is twentytwo per cent., against two per cent., wasted by our branch mint. The total expenditures for three years under Messrs. Birdsall \& Lott, amounted to the large sum of \$1.019,275 39. Under Mr. Hempstead, the total expenditures loe four years were but $\$ 1,150,64814$; while the difference between the last year of Judge Lott and the last year of Mr. Hemstead was upward of $\$ 100,000$ in favor of the latter. On retiring from the Superintendency, Mr. Hemstead left an unexpended balance of appropriation due the mint of up. wards of $\$ 86,000$. This certainly is a capital showing for our mint, and speaks well for Mr. Hemspstead's Superin tendency. Under Mr. Stevens, the present Superintendent, we have no doubt everything wil work in an equally satis: factory manner.

## HOSTETTER'S STOMACH BITTERS,

They renovate, purify and strengthen the system, and aid the stumach in the performance of its functions. It is a sovereign specific for imparting, strength, vigor and tone to
the system, and possessing the curative powers for all disthe system, and possessing the curative
eases arising from a disordered stomach.

DYSPEPSIA,
In all its forms, yields to its control and invigorating properties, and that its return is effectually prevented and the digestive powers prescrved in the fullest vigor by a subse quent, occasional use of this remarkable iavig.
disease would seem to have an infinite variety of

## SYMPTOMS:

Among these are constant pain or uneasiness at the pit of the stomach, oppression after eating, spasms in the stomach and diaphragm, morning nausea, pain between the shoulders, fluttering of the heart, constipation of the bowels, irritability,
broken sleep, nightmare, loss of memory, dimuess of sight, prostration of strength, dull, stupefying headache, want of appetite, flatulency, and a feeling of despondency and despair wholly independent of external causes. All the evils in this mouruful catalogue are not merely alleviated, but invariably removed, by a few bottles of Hostrtter's Bitters.

## LIVER COMPLAINT

Persons who languish for years under apparently incurable affections of the liver, the symptoms of which are pain in the right side, pain in the back and loins, a yellow suffusion of the skiu and whites of the eyes. extreme indisposition to exertion, complete loss of meutal activity, despondeney almost amounting to mania, and great budily weakness, all which are vanquished by the soothing and invigorating properties of this restorative.

## TO PERSONS WHOSE HEALTH IS BROKEN DOWN.

When the flames of life wane and quiver from exhaustion, administer this famous restorative. It will once more become steady and strong. In the debility which follows violent fever, in diarrhcea, dysentery; dyspeptic complaints and cholic ; in the weakness cousequent upon natural decay, or resulting from free living or over-exertion, and also in those painful and too much neglected ailnents to which ladies, are exclusively sulyject, the Bitters never fail to give permanent relief.

## CALIFORNLANS

Should test the merits of Dr. Hostetter's Stomach Bitters. While it is highly palatable as a beverage. it is unequalled as a tonic and invigorator. In the pursuit of a fortune at the mines, many persons are exposed to attacks of com. plaints of the digestive organs, and of various kinds of fever. It is the very article that has so long been in demand at the mines.

## FEMALES.

Thousands of ladies resort to it as a remedy for hysteria, fluttering of the heart, nervous headache, rertigo, general debility and all peculiar disturbances and derangements to which, as a sex, they are subject. It cheers and lightens the depressed mental powers as well as strengthens the body, and its use is never followed by any unpleasant reaction.

> WORD TO THE AGED.

In the decline of life, the loss of vital force consequent upon physical decay, can ouly be safely supplied by some vivifying preparation which recruits the strength and spirits, without entailing the exhanstion which is always the final effect of ordinary stimulau:s. It tones the stomach, inproves the appetite, acts like a charm upon the spirits.

## BOTH SEXES,

Who suffer from general debility, without any physical pain or other symptoms of a deranged organization, will find great benefit from their vivifying influence on the frame and constitution ; and where there is a deficiency of vital force they communicate the energy and vipacity which nature has neglected to supply.
The feeble girl, the ailing wife, the nursling nother, the overtasked man of business, the man of pleasure, under the reaction that follows over-ezertion, and all who have a predisposition to paralysis, will do well to resort to this incomparable tonic and restorative.

DR. HOSTETTER'S STOMACH BITTERS
Should be in the possession of everybody in the mining region. As a preventative against various diseases to which the gold seeker is liable, it has no superior. In all cases of Diarrhcea, Dysentery, and the pervading fevers consequent upon exposure, the Bitters will be found invaluable as a corrective.

## COUNTERFEITS.

Counterfeits are said to be the homage paid by knavery to success, and from these left-handed compliments Hostetter's Stomach Bitters have not been exempted. Vile imitations of the article are abroad, and the public are earnestly requested to be on their guard against them.

Sold by druggists and dealers everywhere.

CORNS AND BUNIONS REMOVED.
Dr. BYRON C. KENNEDY, practical Chiropodist, ate of Philadelphia, would most respect fuily inform the citiZens of Sun Francisco that he has ppened his office at No. 12 Montgomery street, opposite the Lick House, where he is
prepared to remove all excresences, such as Corns, Bunions, prepared to remove all excresences, such as Corns, Bunions,
Inverted Nails, Enlarged Joints, Swelled Insteps, Frosted Feet, Chilblains, Oallosities, and all diseases of the Feet, without pain or inconvenience to the patient.
Dr. Kennedy also attends to Ganglion, or Scorbutic U1cers, and all other diseases of the Skin. He may be consulted at his office, No. 12 Montgomery street, opposite the Lick House, from 9 to 12 A . м..., and 2 to $6 \mathrm{P} . \mathrm{m}$. Having devoted six years of study to this important, bat too much neglected, brunch of human knowledge, and having studied anatomy under the most skiiful and scientific Professors of Philadelphia, and having made this branch of surgical science my speciality for nine years, enables me to operate skilfully and successfully. In England, France and Austria the highest prizes are often awarded to practitioners in this branch of surgical science, and it occupies with others an equally lolty position in the profession.
Voizio is an illustrious example, a shining light, among the philosophical stars of Europe, and Dr. Byron O. Kennedy has fully equaled him in this country, as a proof of which the Faculty of the University College of Philadelphia, Pan, complimented him with testimonials.
Dr. Kennedy has bent his earnest attention to the cure of these diseases, in which he has become so great an expert that he is now regarded as the leader in this cuuntry, in this branch of the profession, througlout the United States,
'The following letter, which emphatically speaks for itself, was written by Dr. W. L. Stevens of the University Colleg. of Philadelphia:
Br. Byron C. Keninerr: Dear Sir-Learning that you are going to take
your departure for California and wishiwg to turm your departure for California, and wishiug to intorm the citizens of Yhila-
delphit and also the people oi the State of California the esteem in which delphit and also the people of the State of Californin the esteem in which
we hold you, and knowiog that nothing is more essental to your success
than the encouragement which you mily recelve from the people of Phila-
delphia than the encouragement which you miy recelve from the people of Phila-
delphia, in the milst of which is the plaggound of your boybond, and
knowing that you have devoted yoars of siudy to this important but too knowing that you have devoted yours of siudy to this important but too
much neglected brancl of buman kowledge; that you have altained to tho highest riak in your profession, serural of the Fucuity and other prominent citrous of Phitadolphia having submitted to your manipulation, we can re-
 will repay yout tor your yoars of study, and chat jou may find a broud fild

Regarding Patents.
We desire to call the attention of all those who intend applying for Patents, to our superior facilities for obtaining the same. Our arrangements are such that we can have all the papers prepared, transmitted and returned, with the Patent Right, in three months from the time the applicant places the matter into our hands; thus saving at least three months delay.

The expense to the applicant would be rather less, if the business be done by us, than if the papers were sent to New York or Washington.
Thus by patronizing a home institution, our inventive citizens can save both time and money.
We have prompt, intelligent and reliable agents in the city of Waskington who attend punctually to all Patent business sent to them. We have agents, also, at London, Paris, Brussels, Hamburg, St. Petersburg, Berlin, Vienna, and other European capitals.

## Distance to which Sound will Travel.

The cannonading at the first battle of Bull Run was eard in Preston county, Virginia, 124 miles distant. At a place called The Glades The sounds were faint, yet dis tinet, and so obviously due to artillery as to attract the attention of very many people and produce the conviction that a battle was going on, though it was supposed at the time to be at no great distance. Two persons in particular, gave close attention to the reports during most of the time. Two young ladies, also, of the family of Mr. Freeland, went after dimner to the top of a hill near by, where they heard the reports more distinctly, and remained there listening an hour or more. At night people carne in from the neighborhood to learn where the battle had been.

At Kingwood, the county seat, the cannonading was heard more distinctly than at The Glades, the place being on higher ground.
Army officers at Oakland, some 15 miles west of King wood, on the Raltimore and Ohio Railroad, heard the same, and said a battle was going on.
The subject was a matter of common remark that day, and the next, before the news of any battle had been received. The sound came from the east or southeast. The day was clear and calm, with little or no wind, The next day the wind was from the east, with rain. The places named are nearly at the snmmit of the Allegtanies. Kingwood is about 125 miles from Bull Run in an air line.
The above facts were communicated by Mr. C. S. Lyman,
t) Professor Silliman of Yale College, by whom they were published in his Journal of Science, with the following commeats :-
It is a commonly receired opinion that sound travels far ther and more loudly on the earth's surface than throngh the air-thus the cannonading at Jena in 1806 was very feebly heard in the open felds about Dresden-distance 92 milesDresden. The Glades are nearly at the height of land of that part of Virginia, probably not less than 2500 feet above the sea. It is certain that at a great number of places with in a radius of 125 miles from Stone Bridge, where the Bull Run cannonading occurred, the sound was not heard-and it seems probable that its distinctness at The Glades was from the experience of aeronauts that sounds are heard with much greater distinctness from the earth to a balloon than on the earth from the balloon. In deep valleys sound may be cut off by reflection, the mountains acting as screenswhile the same sounds are distinctly heard on eminences at greater distances.
This is probably the greatest distance at which cannona ding was ever heard.

Capt. Ericksson says that either of his two new Monitors will, by their great strength and wedge-shaped prow be able to split an iceberg.

Copper Ore.-The Messis Molitor of this city have re cently received a quantity of specimens from the Burr Burri copper mines, Australia, which are quite interest ological interest.

Improvements in Iron and Steel.-At a late meeting of the London Institution of Civil Engineers, a general retrospective view was given of the material progress of the world and the improvements which had been made in the iron manufacture during the last few years, and the changes that were now taking place were referred to ; and it was stated that the result had been that, whereas the annual "make" of a blast furnace in the year 1750 was only about 300 tons, now it ranged from 5,000 to 10,000 tons per annuw ; and, in a lew cases, amounted even to 15,000 tons per annam. In reference to wrought iron, it was said that the plan of reversing the rolls had been considerably extended, and occasionally a second pair of rolls had been placed close to the first, running continually in the opposite direction, so that the iron could be rolled either in coming forward, or in going back. Plates 11/4 in, thick, by 3 feet in wide, and 20 feet long, and plates $41 / 2 \mathrm{in}$. thick by 3 feet wide and 15 feet long had been rolled, as well as bars up to 72 feet long. Most of the improvements in the manufacture of steel had been introduced within the last balf century. Cast steel bells, weighing 5,300 pounds had been made in this country, and castings of steel weighing 10,000 pounds in Austria. Large plates and very heavy bars had been made of puddled steel, produced direct from cast iron; and, lastly, steel wire, when hardened to about a deep blue temper, was found capable of carrying 130 tons per square inch. More than one proces had been used in the production of cheap steel, which had been found by recent experiments to possess nearly donble the strength of ordinary iron, accompanied by other valuable properties. With regard to the application of iron, a new era commenced with the construction of the Conway and Britannia Bridges; as the elaborate experiments made prior to their construction tended to prove that previously received theories were in some respects erroneous. Again, the building erected for the Great Exhibition in 1851, from its lightness and security, called attention to the bitherto uudeveloped capabilities of the combined use of cast and wrought iron for such purposes.

Coal Wasted by Breaking.-An immense amount of coal is wasted in the coal mines by the process of breaking up the coal into the priper size for market. In this opesation a large per cestage of coal is finely pulverized, and is thrown aside as unsaleable. This five and wasted coal is of the purest quality. A correspondent of the New York World, writing from the Pennsylvania coal mines, states That at a single colliery, doing a good business, four hundred tons of coal a day is made to pass through the machine or breakivg up the lumps, and the waste is about twenty per cent., or eighty tons daily. All this amount has to be mined, brought to the breaker, (two iron cylinders, with iron teeth, revolving in a horizontal position, panneled to each other, and about ten inches apart,) and after this process of destruction, has to be carried away and piled up. One will see at any colliery of several years' standing, hundreds of thousands of tons of this now worthless article-very pyramids. All this, except what little is made in the mines by blasting. has to be paid by the operator, aud is a loss to the owner of the land as well as to the human family, and adds price to that which the consumer buys in the market. The waste at the collieries in Schuylkill and Luzerne counties, Pennsylvania, is believed to be over one million tons anuually , worth $\$ 5,000,000$. The question is now asked, is there no way to save this valuable fuel? Here is a chance for inventors. Artificial fuel is now made in England from coal dross combined with a small amount of adhesive substance, such as coal tar, and it is used on long voyages by many of the best steamships. This artificial fuel is pressed into blocks, and is well adapted for packing in coal bunkers.

A new asteroid was discovered Sept. 25th. It is in the constellation Pisces, and is of the eleventh magnitude.

SCIENTLEIC BALLOON ASCENSION.
An interesting balloon ascension was recently made in Englaud by Mr. Glaisher, for scientific purposes. The asceusion was made in the mammoth balloon belonging to Mr. Coxwell, who accompanied Mr. G. as aeronaut. The adventurers regched the highest point, above the earth, ever risited by man, and their obserrations have added an interesting and important chapter to the history of science.The expedition was carried to an extent exceedingly dangerous, and indeed, was near proving fatal to one of the parties. We append the chief points of interest as given

The Frekzing Pons was found at the height of two miles. At an elevation of three miles the thermometer stood at $18^{\circ}$ above zero and at five miles $2^{\circ}$ below and no dew was observed on the hygrometer when couled down to minas $30^{\circ}$. Up to this point the observer, Mr. Glaisher, had experienced no dificulty in breathing, while Mr. Coxwell, in consequence of the necessary exertion he had to make, had breathed with difficulty for some time.

Dimness of Sight beman to be experienced at an eleration of tive and a quarter miles, which Mr. G. thus uarrates:
At a height of about $51 /$ miles, I read the dry bulb as minus $5^{\circ}$ : in endearoring to read the wet bulb I could not lens, and also failed. I then tried to read the other instruments and found I could not do so, nor could I see the hands of the watch. I asked Mr. Coxwell to help nee, and he said he mast go into the ring, and he would when he was lying on the table at about the distance of a foot from my hand, and found myself unable to do so.

Total Loss of Power was indicated at about five and three quarter miles elevation, as will be noticed from the following continuation of the above paragraph;-

My sight became more dim : I looked at the barometer and saw it between 10 and 11 inches, and tried to record it, bot I was unable to wriet. I then saw it at 10 inches, still
decreasing fast, and juist noted it in my book; its true reading, therefore, was at this time about $93 / 4 \mathrm{inches}$, implying a height of about 53.4 miles, as a change of an inch in the reading of the barometer at this elevation takes place on a all power, and endearored to rouse myself by struggling and shaking. I attempted to speak, and fonod I had lost the power. I attempted to look at the barometer again my head fell on one side. I struggled aud got it right, and it fell on the other, and finally fell backward.

My arm, which had been resting on the table, fell down by my side. I sanr Mr. Coxirell dimly in the ring. It be-
came more misty, and l sank unconciously as in sleep. I cane more misty, and l sank uncouciously as in sleep. X Take an obserration; now try." But I could neither see, move nor speak. I then heard him speak more emphatically; "Take an observation : now. do try." I shortly afterward opened my eyes, saw the instruments and Mr. Coxwell very
dimly, and soon saw clearly, and said to Mr. Coxwell, "I dimly, and soou saw clearly, and said to Mr. Cuswell, "I
have been insensible;" and he replied, "You hare, and I nearly."

I recovered quickly, and Mr. Coxwell said, "I have lost the use of my hands; give me some brandy to bathe them.' His hands were near y black. I sam the temperature was increasing quickly. I resumed my ebservations. I found that the water in the vessel supplying wet bulb thermometer, which I had by frequent disturbances kept from freez. ing, was one solid mass of ice. Mr. Coxwell then told me that while in the ring he felt it piercingly cold, that hoar frost was all round the neck of the balloon, and on attempt 1ng to leave the ring he found his hands frozen, and he got down how he could; that he found me motionless, with a quiet and placid expression on the countenance. He spoke me rithout eliciting a reply, and found I was insensible.
He then said be felt insenisbility was coming over himself; that he became anxious to open the valre; that his
hands failed him; and that he seized the live betireen his hands failed him; and that he seized the liue betireen his
teeth, and palled the ralve open until the balloon took a turn downward.

Mr. Glaisher is of opinion that the balloon, during their state of partial insensibility, and at the time Mr. Coxwell opened the valve with his teeth, must have stood at an altitude of 6 , if not $6 \stackrel{1}{2}$ miles from the earth !
Six pigeons were taken up. One was thrown ont at the height of three miles; it extended its wings and dropped as a piece of paper. A second, at four miles, flew vigorously round and round, apparently taking a great dip each time. A third was thrown out between four and five miles, and it
fell downwards. A fourth was thrown out at four miles, fell downwards. A fourth was thrown out at four miles.
when we were descending; it flew in a circle, and shortly afWhen we were descending; it flew in 』 circle, and shortly afpigeons were brought down to the ground. One ras found
a note. It would not, however, leave, and when jerked off the finger, returned to the hand. Atter a quarter of an
hour it began to peck a piece of ribbaud encircling its neek hour it began to peck a piece of ribband encircling its neck
and I theu jerked it of my finger, and it Gew round two or three times with vigor, and finally towards Wolverhanupton. Not one. howerer, had returned there when I left ou the afternoon of the 6 th.
$\mathrm{Mr}, \mathrm{G}$. adds the following by way of inference;
It would seem from this ascent that five miles from the earth is very near the limit of human existence. It is possible, as the effect of each ligh ascent upon myself has been different, that on another occasion I might be able to go higher, and it is possible that some persons may be able to exist with less air and bear a greater degree of cold ; but still I think that pridence would say to all, whenever the barometer readiug falls as low as 11 inches, open the valve at once; the increased information to be obtained is not commensurate with the increased risk.
The London Times, commenting upon the perilous enter prise, observes
The aerial voyage just performed by Mr. Coxwell and Mr. Glaisher deserves to rank with the greatest feats of our experimentalizers, discoverers and travelers. It is true these gentlemen have not brought down a very comfortable or in spiring report of the upper world into which they have pen-
eirated. Science and poetry are unhapily rather at variance upon the subject of the air and the sky. Poetry points up ward to the sky with glowing rapture as the scene of brightness and gloiy, and a residence there figures as the reward of heroism and grentness. Everything is happy and splendid that is connected with the sky. But science penetrates with its material, ye into those vast upper spaces and simply eporis a great difficulty of breathing there; that the blood stagnates, the limbs hecome benumbed. the senses evaporate, and natare faints in unconciousness. The very birds will not Gy in that verysky which is their poetical home. The distinction is that poetry looks up to the sky from below, and science examines and feels it on a level. The sky is the emblem of poetry, the fact of science. Both aspects of it are
equally true, but the point of view from whin they are taken is quite dfferent. But, though our recent explorers of the sky do not add to its brilliancy as a pieture, they have furnished one morestriking and impressive scene to the his'ory of science. They hare shown what enthusiasin science can inspire and what courage it can give. If the man, as the poet says, had need of "tripple steel about his breast" who first launched a boat into the sea, certainly those had no less need of it who first floated in the air six miles above the surface of the earth.

Mark West Crerk Coal.-The newly opened coal mine is a matter of no ordinary interest to the people of this part of the coustry, and great hopes are entertained of its extent and value. A sample load of the article was shipped on Wednesday to San Francisco, where judgement will be pronounced of its merit. Should the quality prove good, no one as yet doubts of the quantity obtainable. The company, styled the Healsburgh Coal Mining Company, was formed about the first of May, and has been prospecting up to the present time, having, at the depth of 126 f. et, found a
ledge of coal that works well in a forge, and we think will turn out better than any yet found in the State for the manufacture of gas. We understand the company intend furnishing the Petaluma steamers a sufficient quantity to prove its efficacy for steam and foundry purposes.

Wattles.-Healsburgh Review.

Magntefcent Tien of the late Battle of Antietain A correspondent of the New York Tribune writing of the great battle of Antietam, on Wednesday, September 17, says: The opportunity for seeing the battle was unparalled. siugle stand point commanded nearly the whole field from dawn to dark. No one who looked upon that wonderful panorama can describe it; neither can any one who saw forcountry, and he was pressed back. But every hill and val ley, every corn-field, grove and cluster of trees was fiercely fought for. The artillery was unceasing; we could ofter count nore thac sisty guns to the minute; and the muskelsy was like the patter of rain drops in an April shower.
On the great broken feld were riderless horses and scatterOn the great broken field were riderless horses and scatter
ed men ; clouds of dirt from shot and exploded shells, long dark lines of infantry swaying to and fro, with columas of smoke rising from their muskets-with flashes and white puffs from the batteries-with the sun shining on all this scene of tamult, and beyond it, upon the dark rich woods and the clear blue mountains, flows the Potomac. Amid all the screaming of shot and thundering of cannon and whist ling of balls with the fearful caruage they brought, I saw no considerable breaking among our troops, save with severa

Silyer Mining in Norway.-The silver mines of the vition of the English mining public. It is reported that an English Company has purchased the Anna sophia district, and intends to work it in a spirited manner. Operations hare been suspended there since 1805 . A correspondent of the London Mining Journal makes the following observa-
The Kongsberg Mines are unquestionably very remunerative, but the State retains in its own possession the very limited territory where native silver is likely to be found in sufficient quantity to pay for working. A Norwegian comipany has for some years been exploring the most likely district jin the neighborhood of the Kongsberg Mine, and every year cousiderable calls have been made. The other setts were taken up by speculators without capital, on the chance of selling them in London; though such a transfer is, by the conditions of the auction at which the setts were ac quired, illegal. No doubt silver exists beyond the bounds of ties, as well as by the Gorernment, prove it ; but the quan tity has been in every case inadequate to meet the expenses; and whatever is found must be sold at a fixed rate to the royal smelting-house.

Stratgiteninga Chimner Stack.-This operation, for restoriug the collossal chimuey at Port Dundas to a perpendicular and safe position, has been successfoly completed.This was accomplished by sawing several of the mortar beds between the cources on the side from which the chimmey leaned, thereby allowing it to come back by its own weight, without the application of any exterual force. Only one droft was cut at a time, to guard against any shock which might have endangered the stability of the building ; and by keeping the saws wet, a bed of mortar was prepared for the superincumbent weight to settle down upon. Twelve cuts were made in this manner on different parts of the structure, which generally set before the saws had passed through half of the circumference, particulariy in those made nearest the ground, where the weight was greatest,
Mr. Duncan Macfarlane, architect, by whose advice this method was adopted, saperintended the undertaking. The principle dimensions of the chimney are:-'L'otal height, 408 feet; from surface to top of the coping, 454 feet ; out side diameter at foundation, 50 feet; at surface, 34 feet; at coping, 14 feet. According to calculations made by Professor Rankine, the building, independent of the adhesion to mortar, is capable of sustaining with safety a lateral pressure of 66 los. per saperficial foot at its weakest point, being 11 ibs. more than the force of the greatest storm registered in this country.-North British Mail.

A5s A great rarity in the shape of a coin has lately been sold in Paris, namely, a silver one struck off at Breslan, 1751. Among the persons employed at that time in the mint was an Austrian, who, out of hatred to Frederick II, of Prussia, who had taken possession of Silecia by right of conquest, conceived the idea of revenging himself on that monarch in the following manner: The motto on the coin, Ein reichs thaler," [a crown of the kingdom,] he divided in such a manner as to make it read, "Ein reach stahler,' (he stole a kingdom.) The king ordered these insultid
coins to be all melted down, but some of them still exist.

AEs A new field gun has been invented, designed to throw grape and canister with tearful rapidity and effect.It consists of five barrels, a sliding breach, having a corres ponding number of chambers in which the charges are in serted, the gunner having no occasion to go to the front of his gun. A shield of metal plate, at an angld of forty-five degrees, protects the gun and the cannoniers. It is easily coustructed, and in an emergency may be effectually disabled. The chambers are formed by longitndinal bars, the whole securely bolted together. The bore is square. The inventor claims to be able to throw with a full battery near ly a thousand pounds of grape in every forty seconds. I'he gun, by a pecuisar constrnction, scatters sideways only, not up and down, as in ordinary guns.

Tae Coal Fields of Onio.-It is almost melancholy to contemplate the vast beds of coal and ore in the United States, and see how little there has been done to develop them, while we are annually paying Great Britain millions upon millions of dollars for iron manufactures. The coal fields of the single State of Ohio are larger than those of Great Britain, while the latter has been used with such skill and energy as to create a manufacturing industry and production, beyond anything the world has ever seen, in an equal space. Ohio can produce more than thirty times the coal it now produces annually. The entire amount of cial annually produced in Great Britain, may be mined in Ohio for 500 years, without exhansting more than one seum, there are four or five seams. The 12,000 square miles of coal in Ohio is scarcely a fourth part of the coal basin of Which it is a part, compreheuding large portions of Western Pennsylvania, Virginia, Kentacky, and Tennessee. This is the Eastern coal deposit of the North-Western States but there is also a Western of still greater magnitude.

## to shining companies.

We earnestly solicit from mining companies and asspciations the following blunk statement, filled according to the data hereby accompanying. 'I'he purpose for which we seek this information is impurtant to overy citizen and stockholder on this coast ; it would also be prodnetive of beneficial results-i. e., inducing capitalists to invest in our mining operations, thereby infusing nevv life and vigor into business generally in our States and Territories. Little, if anything, is known of our metallic wealth in Europe or the Eastern States, hence we desire as much of the blank filled by you as may be interesting and instructive to the people of this State and those interested abroad.
We know of no mining district in Furope or Americu where this kind of information is not willingly rendered by parties owning property of this nature; and we know of no better medium for making public the richness of our mines. We shall send blanks to mine and uill proprietors for every quarter, and will gladly publish the contents for the information of the community:

vertising Medium to be found in the country.

Notice to our Friends and the Pablic.
The undersigned, your most obedient servant, begs Jeave to retire from the publication of the far-famed and widespread Mining and Scientific Press. In bidding adieu to my many friedds and patrons, I cannot omit expressing my sincere thauks and obligations for the many favors and kind acts rendered unto me: We leave the tripod with regret, though a responsible one, and full of care and much laborFor three years have we labored and toiled for the advancement and progress for which the Press has been called into existence, and we are asured and feel confident that we have not labored in vain. There is, however, much evil to be remedied, and this we leave to our able successor, W. B. Ewer, Esqq, who will from this date conduct the Press, with his usual good judgment, talent and capacity. I wuuld ask the friends of the Press to aid him in his efforts, and to perpetuate the advocate of our chief resources.
In a few months, we take our departure for the Atlantic States and Europe, for the purpose of rendering great service to our Pacific States 1 of which due notice will be given. We sever our connection with the Press so far as business matters go, but we shall ever find time to give through its columns matters of importance regarding discoveries, inventions and improvements in every branch of science, arts and industry, especially when we shall be far off on the European Coutinent. .Very respectfully,

Julites Silversmitre.
San Francisco, Nov. 1st, 1862.
No portion of the globe offers a more inviting field for the publication of such a paper as is contemplated in the prospectus of the Mininq and Scientific Press, than the state of California. The mineral resources of the -Paciicic coast have already astonished the world-not less by their unparalleled richness, than in their remarkable variety and extent. Though but litile over a single decade has elapsed since California was known simply as an exporter of hides and tallow, still that brief period of time, under the magic influence of the few grains of shining metal accidently brought to light on the banks of one of her mountain streams, has been sufficient, under the potent direction of Anglo Saxon energy, to establish within her borders the foundation of an empire which is even now felt as a power in the woild, and to which the nations are already looking as the great center from whence, at no distant day, must radiate all the chief arterial currents which give life and energy to every department of industry and cummerce throughout the earth.
The mineral resources of the Pacific coast, great as they already appear, are yet only in the infaney of their development. Hitherto the attention of our people has been mainIy directed to searching for the precious metals. In the early future a heavier and much more important class of mining is to be undertalsea. Recent explorations have pretty fully demonstrated the existence, in our valleys and mountains, of unlimited quantities of coal, iron and copper, which are the real foundations of all material wealth, and without which no people can hope to rise to any commanding position in the present progressive age of national advancement.
With such a field before us, and in a community so prolific of publications on almost every cenceivable topic, it would indeed be a matter of surprise if not one journal was found devoted to the great leading interest of the State,
and to the mechanieal and industrial pursuits which are the necessary adjuncts of every important mining community Such a paper wo have-already establi-hed and contiuued for upwards of three years, under diseouraging circumstances it is true, but nevertheless continued as the only especial exponent and advocate of an interest, second in prospective importance to none on the globe !
The course of events has thrown this publication, known as the Mining and Scientific Press into the hands and under the control of the undersigned. Numerous friends and parties having a deep interest, pecuniarily and otherwise, in the development of the miveral resources of our state, and the permanent establishment of an organ which shall be a suitable and worthy exponent of such an enterprise, have induced us to undertake the task of its editorial control. We should shrink from such a responsibility were it not for the fact that we have been promised the aid and assistance of numerous well known writers, of practical and scientific attainments, to assist us in our labors; and it is in confident assurance of such aid that we venture to promise the readers and patrons of the Press that this publicaton shall be made both a welcome and instructive visitor to the miner, the mechanic and the merchaut; and that its columns shall ever be replete with information useful and interesting, embracing within its scope all the arts and sciences, and trades and manufactures, in addition to the great leading features of mining and metallurgy.

The miner will find from time to time, carefuily digested, every class of information which shall be useful to himi iu his laborious and precarious calling. We shall arrange, at on earily day, for careful and reliable correspondence from all the important mining sections of our state and the Pacific coast generally, not forgettiag the great mineral region now loomiag up in such magnilicent proportions all along our eastern mountain border. Particular attention will also be devoted to the general interest and advancement of the mechanic and workingman ; and especial effort will be made to render the columns of the Press useful, instructive and advantageous to their peculiar ioterests, by imparting to them early and full knowledge of late and approved discoreries in science and art, and placing in review before them the most useful information already obtained and reduced to practice in their various departments of industry.
In fact, to everything coming within our peculiar field of observation, we shall pay especial attention. The importance of home manufactures and productions, and all efforts of native ingenuity and talent will receive encouraging notice. We shall endeavor to keep our readers properly advised with regard to what the philosopher, the inventor, the artizan, the mechanic and the miner may be doing, each in his pecoliar department, whenever such knowledge shall be deemed of general interest or utility. With these purposes well and truly carried out, we feel assured that our efforts will not be without avail in the general accumuation of useful knowledge, and that they will be duly appreciated, and rewarded with a commensurate support from a community so proverbially liberal in the encouragement of all neful undertakings as Ca'ifornians are universally acknowledged to be. W. B. EWER.
$V_{\text {rry }}$ Likely.--British traders and trappers have found diggings on the east side of the Rocky Mountains, a few miles south of the national boundary. They express the hope that our Government will permit the alteration of the line so that those mines shall be in the British possessions. This expression of "hope" is very modest, to say the least; and we presume the recent cordial and humane acts of our British friends in allowing the fitting out, repairıng and coaling of rebel privateers in their harbors, and at the same time refusing federal war vessels the same priviledges, are considered by them as fully warranting the inference that our Goverument will, in return, oblige them hy changing the national boundery so that certain mines now our own may become British property-very likely!
A Saving.-The California merchants are now paying their debts in legal tenders. By the last steamer one could purchase a draft for $\$ 1,000$ by paying $\$ 800$ in gold, so that the Califoruia trader saved twenty per cent. A handsome profit and easily made.
A new style of light wagon now driven by gentlemen on he road in England is called a wagonette.

A Vrity Proper Precaution.-The Grand Jury of Virginia City, N. T., at their late sitting, recommended that their representatives in the next T Territorial Legislature should advocate the passage of a law compelling. the owners of mining shafts, not in use, to either fill them up or cause them to be properly secured agaiust the accident of persons falling into them. This we conceive to be a very wise and proper precaution, es pecially in the vicinity of all populous neighborhoods. Scarcely a week occurs that we do nol notice the result of severe or fatal accidents which have occured from this source. As we write, oo less than three are noticed in papers lying upon our desk, one of which was fatal. Such legislation might be had as would empower municipal authorities or county supervisurs, to take notice and designate such localities as it might be deemed proper to keep guarded against this class of vecidents. Heartless and deficient in every human feeling must be any party or parties who, atter digging a shaft for the purpose of obtainiug "filthy lucre," and after finding themselves disappointed fail or refuse to place some safeguard over the dangers they have created.
The San Francisco Quicisiluer Mine,-Quite a little excitement was created on Montgomery street a few days since by the exhibition of a very pretty specimen of cinnabar, said to have been taken from a leagé upon the line of the Spring Valley Water Works, at the point where the Company is constructing a reservoir, near the Orphan Asylum. The specimen referred to was quite rich, but a subsequent visit to the locality faled to convince as that the "discovery" is very promising of any other mineral than an excellent article for McAdamising the sandy roads of that vicinity.
A New Invention.-The success of Ericsson in revolutionising naval warfare by the construction of his Monitors, seems to have given a new direction to Yankee ingeunity.Having taught the world how to build and fight those naval monsters, our inventors have already eutered upon the task of teaching it how th destroy them. If they do not succ ed we shall think the "Universal Yaukee" has forgotten his cunning-or iu common parlance is "played out." That such is not the fact we have an en rnost in the following paragraph which we clip from an Eastern Exchange:-
A correspondent of the Boston Traveler, writing from the United States steamer Kearsargo, says that the Chief Engineer of that vessel. Whittaker, has made an invention designt d to destroy iron plated vessels, and that the officers all belleve that he has succeeded. The Cuplain has ordered him home to report to the Nary Department.
Modntain Heights-The height of Mount Shasta has recently been taken by Professor Whitney, of the California Geological Survey, and ascertained to be 14,440 feet above the level of the sea, or 1,450 feet higher than Mount Hood in Oregon. Mount Shasta is the highest mountain in the United States, the measurement of which has been scientifically ascertained.
During the recent visit of the Professor to Washoe, he also ascertained the beight of Mount Davidson 7,827 feet above tide water. Mr Whitney is provided with excellent instruments, and his estimates can be relied upon as correct.
Pronunctation of "Aftietam."-The Baltimore Ameri-ean--good authority-says that the name of the last graat battlefield, should be pronounced An-tee tana. This is not only euphonious, but is the pronunciation employed hy the inhabitants of that vicinity themselves. It is well that a name which is destined to occupy such an important place in history should be correctly pronounced by the people to whose glory it will redound.
An account of a tremendous hail-storm in West Lavington and Easterton, England, is published in the London Times. It is said that the hail fell to the astonishing depth of seven feet in less than half an hoar. Large fields of unharvested crops were ruined, and many fowls were killed.The hail was accompanied by rain, and a fearful flood result-
ed, which filled cellars and greatly increased the damage ed, which filled cellars and greatly increased the damage done.
Cambis. - A train of six Bactrian camels arrived in Virginia Oity, N. T., recently. Each animal came through with six hundred pounds on his back.

## The DNABHilty of Matter.

Everything which is the olject of our senses is composed of matter differently compreea or arranged. But in a philosuplacal sense matter is defined to be an extended, eolid, inactive and moveable subetauce.

Every portion of matter, however minate, must have two surfaces at least, and it follows of course that it is divisible; that is, the upper aud lower surfaces may be separated; and though there may be particles of matter too small for ws actually to divide, yot this arises from the imperfection of our instruments; they must nevertheless, in their nature, be divisible. A few years since a lady spun a single pound of wool into a thread 168,000 yards long. And Mr. Boyle mentions that two grains and a balf of silk were spun into a thread 300 yards in length. If a pound of silver which contains 5,760 grains, and a single grain of gold be melted together, the gold will be equally diffueed through the whole silver, insomuch that if one grain of the mass be dissolved in nitric acid, the gold will fall to the bottom. By this ex periment it is evident that a grain may be divided into 5 . 760 visible parts, 5.751 st part of the gold is contained in a single grain of the mass.

Goldbenters can spread a grain of gold into a leat containing 50 sqnare inches, and this leal may be easily divided into 500,000 parts, each of which is visible to the naked eje; and by the use of a microscope, which magnifies the area or surface of a body 100 times, the l00th of each of these is visible : that is the 50 millionth part of a grain of gold will be visible, or a single grain of that metal may be divided into 50 millions visible parts. But the gold which covers the silver wire used in making what is calied gold lace, is spread over a mach larger surface, yet it preserves, even if examined by a microscope, an uniform appearance. It has beən catculated that one grain of gold, under these circumstances, would cover a surface of nearly thirty square yards.

The natural divisions of matter are still more surprising. In odoriferous bodies, such as camphor, musk, and asfoetida, a wonderful subtlety is perceived ; for though they are perpetually filling a considerable space with odoriferous particles, jet these bodies lose but a very small part of their weight in a great length of time.

It is said by those who have examined the subject with the best, glasses, and whose accuracy may be relied on, that there are more animals in the melt of a single codfish, than there are men on the whole earth, and that a single grain o sand is larger than four millions of these animals. Now i it be admitted that these little animals are possessed of organized parts, such as heart, stomach, muscles, veins, etc., and that they are possessed of a complete system of circulating fluids similar to what is found in larger animale, we seem to approach to an idea of the infinite divisibility of matter.
It has been calculated, that a particle of the blood of ove of these anamalcule is as much smaller than a globe onetenth of an inch in diameter, as that globe is smaller than the whole earth; Devertheless, if these particles be compared with the particles of light, it is probable they would be fonnd to exceed them in bulk as mnch as mountains do grains of sadd. Many other instances of the extreme divisibility of matter, might be enumerated but these are sufficient to show into what very minute parts matter is capable of being divided.

We shall sead copies of the present issue of the "Press" to many of the old subscribers to the "Califarnia Miming Journal," formerly publishtd in Grass Valley, Nevada Coun.ty. We should be pleased to add the names of such of our old friends and former readers of the Mining Journal, as may choose to aid us in our present undertaking. The "Mrning Journaland Scientific Press" will be published every Saturday morning at $\$ 4$ per annum, at No. 24, Fuderal building. San Francisco, and being the only mining paper in the State we trust the friends of mining enterprise, and all who wonld keep thoroughly posted with regard to the great leading interest of the State, will send in their orders for the Press: The paper has now become permanently established, having already entered upon the fourth year of its existence.

The Herald of this city, of a recent date, chronicles as a notable circumstance, the fact that not a single mining company was incorporated on the day previous.

Treatimg Iron I'ybires.-An invention has recently been patented by Mr. Juhn Longmaid, of Scotland, for treuting iron pyrites and other ores containing copper, silver, and tin, or either of them, and sulphur, which consists in frst crushing the ore and passing it through a sieve having about 100 hules in the square iach, and afterwards calcining it and treating with common salt. The invention appears to be a modification of or improvements upon, the inventions of Mr. William Lougmaid, patented 1842,1844, and 1845. According to the new invention the partially culcived pyrites and salt are kept at a low red heat, until decomposition converts them into sulphate of soda and soluble chlorides of the inetals. These are washed out and precipitated with iron in the usual manner.

A Nem Application or Stease-A novel experiment is announcarl as soon to be tried by a steam fishing $v$ essel lately fitted up at Leith. Her trawling gear, which is very heavy, is to be wound up by a capstan driven by steam power, and all living fish thus taken will be put into a well, or salt water aquarium, having a constant circulation of water through it, and thus the fish will be kept in existence until brought to market. This is suid to be the first direct application of the steam engine to the purpose of catching fish.

Srlver Bricks.-The citizens of Virginia City, propose to send to the Sanitary Coinmission, the sum of $\$ 20,000$ in silver bricks. The Enterprise says : The shipment will be made in solid silver bricks, stamped wi $h$ an appropriate inscription, and will prove the biggest ad vertisement for Novada Territory that ingeuious brains have yet conceived.Chese sillver bricks will be curiously examined and commented on by many a man in New York who would forget in fifteen muntes after he heard it, the fact that $\$ 20,000$ in gold coin or Treasury notes had been sent from the unknown land of Nevada.

North Pactfic Review.-We have received from Messcrs A. Roman \& Co., Montgomery Street, the first and sec. ond numbers of the North Pacific Review, published in this city, and find them well filled with interesting matter, both original and selected. Each number is illustrated with an engraving, those in the numbers before us being portraits of the late James Donahue and the late Col. Doane-the latter of which is a remarkably striking likeness. The contents are varied to suit all tastes, from the lively, sparkling sketch, to the more sober paper on mining, scientific, or agricultural matters. A well written chapter of notices of new publications, being also one of the features. Judging from the numbers before us, the North Pucific bids fa ir to take a permanent place, as a first class literary monthly.

The Californa Iron Ceiad.-The iron clad steamer for the defence of this harbor and coast, is rapidly approaching a coropletion. She is to be called the "Comanche," and will be a beautiful specimen of navel architecture-The NewYork correspondent of the Marysville Appeal states that when all is finished she will be put together, tried, and if everything works rightly, she will then be taken to pieces and shipped to California. She will difier in several particulars from most of the other Monilors ; but all visitors are requested not to make public her important features. Her length is 250 feet, bredth and denth proportionate, and she is to be coated with iron of immense strength, and great thickuess ; and, in view of the precions national treasures she is to guard, she will carry a terrible armament.
"Old Virginia" vs. Opair--The Territorial Enterprise of Octuber 31st, in its "Stock Remarks" says :-
The "Old Virginia" bubble seems to have exploded; at least, there is little or no demand for Virginia. It has been offered to-day at a comparative low figure, with no takers.

Tee connection of the present editor with th's paper having been consummated somewhat hastily and unexpedly, he will be under the necessity of begging the indulgence of the patrons of the paper for a delay of one week in the next is-sue-a delay unavoidable to allow him time to visit his late mountain home and make the necessary arrangements for a permanent removal to this city. The next issue will therefore be made on Saturday, November 15th.

## WASHOE ITEMS .

Tife Gocsd and Cury Mili.-'The Enterprise says that a large number of workmen are engaged upon this great work. A huge ore-house has been erected near the mill, and two or three immense walls are being constracted of cut stone for the protection of a terraced road-way and a large yard. A village of fifteen or twenty neat frame houses hus sprung up about the mills, and everything in the neighborhood tells of an industrious and prosperous community. Ore from the Gould and Curry mine is now being crushed at the Hoosier State mill.
The Danfy Mrli, is a large first class mill, and fast approaching completion. We learn from the Enterprise that the mill contains fifteen stamps, twelve iron-bottomed amalgamating tubs, and three large "treating-tubs." The latter are to be placed near the batt ries and will be used for mixing the chemicals used with the pulverise d ores. The floor of the room containing the batteries and treating-tnbs is several feet higher thau the amalga mating room, thus greatly facilitating the distribution of the pulp thro ughout the building and saving much labor in the various departments.
The Company has a large amount of wood piled up near the mill, and will be enabled to "fire up" the moment their mill is completed. Many improvements are being made in the mine. A very rich vein has lately been struck in the lead, which consists of a species of brown, compact earth or decomposed rock, which is literally full of bright, glistening gold. This seam or streuk, as far as opened, varies from two inches to a foot in width-the entire lead being about fifteen feet in width.

The castern extension of this mine is known as the Caney lead, and has been traced for a considerable distance. On the west extension is the Governor Nye Co., who are now cutting through what is supposed to be the wall-rock of the same lead into a reddish, decomposed earth which yields very fair prospects in gold.
We clip the following items from the Territorial EnterBuilding Lots.-Hundreds of building lots have lately been staked off east of town by speculative peg-drivers. We shouldn't wonder if there was money in those lots. This city would not stop growing should it try. 1t's bound to go ahead, and must have some place to spread.
Brevoort's Mills.-Ool. Brevoort's new mill is rapidly advancing towards completion. A commodious gallery has lately been built, connecting it with the old mill.
Trenca's Mrul-Additional batteries are being erected at this mill, and there will be a considerable increase in its capacity for amalgamation.
A New Mill.-The foundation for a very large new mill, to be called the "Rhode Island," is being built on Gold Canon, a short distance below Gold Hill.
The New Succor Mill.-This on Gold Canon, near the Succor mine, is in full blast. It is a very little affair, and conveniently arranged.
Gold Canon Reductron Works.-Some addition has lately been made to the amalgamating machinery of the Gold Canon Reduction Works. 'Ihis consists in seven new five foot pans with Wakely, or rather improved Wakely, mullers. The new machinery was started jesterday morning.
The Hooster State Mill.-This new mill works as smoothly and correctly as a well regulated watch, and is one of the neatest and most substantial institutions in the district. It is crushing the Gould \& Curry rock at present.

Tar Spring.-The Territorial Enterprase mentions the discovery of a tar spring-petroleum probably-which is located between Mud and Pyramid lakes. This spring emits athick, bituminous fluid; the discharge being quite hot where it bubbles out of the earth. According to the Enterprise, the Iudians frequent the tar spring for the purpose of pitching their baskets and willow water vessels.
Virginta City Potterx.-The Territorial Enterprise of the 31st ult. says:-"A kiln of fine glazed ware is ready for drawing at this establishment. The proprietors find no difficulty in disposing of their ware.

## The next Mining "Sensation."

Late Victora papers, received at this city, are filled with glowing accounts of extraordinary gold yields from the placers of Fraser river, Cariboo, Similkameen, etc. The Colonist published in that city says that the late arrivals of gold from those places "puts to blush the croakers who have come here and left," and asserts in the very face of the ragged and starving thousands that are fleeing from those localities that "there will be good diggings there for the next teu or twenty years; and that it will take five years to get theru opened." Still, as if doubting the posibility of again inducing a crowd of adventurers to visit aud leave their money, if not their bones, in those same localities, that paper has the presumption to announce "new and important discoveries," still further north, beyond the Fraser and over the divide, along the waters of Peace river, which find their outlet in the Arctic Ocean! "There," says the Coionist, "we are met by a new II Dorado, where the miner can render muddy by his industry, waters that fall into the Arctic Ocean." Further on, in the same article, we find the following significant parugraph :-
"We really claim to have a greater extent of gold-bearing country than any other country in the wirld. [! ]
With our small population we are doing wonders in discov-
ering it. [No doubta] What we want from abred ering it. [No doubta], What we want from abroad are with the "blues" and hardships of a rugged country-rugged above the average. We want for next year, mules, packhorses, freight.wagons, stage-coaches, steamboats, expressmen, mail-carriers in all directions, coasters, seamen, and merchants. The more we get of these classes-not forget-
ting the farmer-the better. [No doubt of it.] Here is the ting the farmer-the better. [No doubt of it.] Here is the
field for speculation, enterprise. We assert it, we know it, are sure of it, have not a doubt about it, that our Pacific T'erritory is a rich one in gold." [!!!]

Other columns of the Colonist are filled with details of "rich strikes', and "extraordinary yields," from which the uninitiated might be led to suppose all one had to do was to go to the mines and scrape np gold by the handful ! Who does not see in these paragraphs the most unmistakeable evidence of the ground work of another mining "sensa uion" for the coming season?

Whatever may be the ultimate value of British Columbia as a mining region, certain it is that, notwithstanding the vast pretentions of the Colonist. and other journals in like interest, (some of which may be found in this state,) we have, as yet, no reliable evidence upon which to base the propriety of any exteusive mining emigration to that quarter. Still as it seems to be a sine quanon with California, that she must have her periodical mining excitements, we trust, if such things are to be, the speculators will hereafter select for theirfield of operations, some locality within the confines of our own state, so that those who are bent upon going upon a fool's errand may be kept within easy reach of their friends, and be induced to spend their money for the benefit of their own countrymen.
It is now upwards of four years since a base and nefarious set of swindlars, made up of steamboat and ship owuers, and land pirates of every specie and class that can thrive by such excitements have been annually enticing thousands upon thousands of miners from California, and people from other parts of the world to try their fortunes among the placers of British Columbia. After each year of failure they hove been told that the new El Dorado was certainly to be found ooly a little farther beyond the point visited the previous year-that they were sure to strike it, if they per severed, and return, every one with a "pile," if they would "only go a little farther North or East this year!"
Each fall the roads from these regions have been thronged with these same thousands, returning from their explorations, disgusted and discouraged, and, in a majority of cases with nothing but rags to cover their nakedness and scarcely a dollar to provide that sustenance which is doled out to them by these same speculators, at enormous prices. Huadreds we are told, have put a violent end to their existence, or sat themselves down to die after their last possible effort to escape from this modern Golgotha. These are facts-not fancies-as may be almost daily brought to the knowledge of every person residingin any of the principal commercial or mining centres of the State, who will take the least pains to enquire into them. The present is no exception to the rule, but has been quite as disastrous as any season which preceeded it. And yet the journal already alluded to, as
published in the chief city of that region, has the effrontery to jeer at the great array of sufferers hastening home from that inhospitable country, ere the rigors of a northern winter deprive them of the last hope of ever again reaching the bounds of civilization-it denounces them as 'croakers' etc.!
The press throughout this state has, year after year, given timely cautions against these delusions, and pointed to the well attested facts that such reports are all got up for spee ulative purposes, baving, it may be, some few data from which to work; but showing that they were, in the main, baseless as the fabric of a dream. We trust that now, at least, the days of humbuggery and excitement, in this peculiar channel, at least, have gone by and that our miners will hereafter conclude to let well enough alone, and adhere to the good old adage that "a bird in the hand is worth two in the bush." Let them pay no farther attention to the of repeated tale of rich and richer mines far and still farther north. Tet them endeavor to settle downinto the reasonable conclusion that the extraordinary, stories of rich diggins now coming in from the distant Peace river mountains, are but rep etitions of the "same old story,", and resolve to settle down quietly, even if they do not earn more than $\$ 21 / 2$ or $\$ 3$ per day, since, in the end, they will even at that, with economy and industry, amass a competence for old age.

Henness Pass_Road.-A new line of stages has recently been put on between Grass Valley and Virginia City, connecting with the California Co's coaches at the former place The first trip over this road was made in 17 hours 40 min ates, traveling time. Travelers will find this decidedly the best route of travel to Virginia City. Arrangements have been made by the Stage Company and the people living along the route to keep the road open through the winter, and in good condition for teaming. This can easily be done, if entered upon with a will, and would be of vast benefit to both California and Nevada Territory.

A Wise Move.-The wine growers of Anaheim have joined in an association called the United Wine growers of Anaheim, the purpose of whioh is to establish a depot in San Francisco, where their wine can be obtained in abundance and purity.

Recent Patents-Granted to California Inventors througla the Pacific Agency, J. Sietersmith, Solicitor:
E. E. Matteson, Nevada: Hydraulic Derrich. This invention has been illustrated in this journal, and has obtained great celebrity throughout the State.
Elander Heata, San Francisco, Spiral Spice and Sage Mill. See "Mining and Scientific Press," June 9th, 1962, Vol. V., No. XIII.
G. F. Deetken, formerly of Nevada: Apparatus for separating Gold from Pyrites. This is one of the most useful inventions of the day. Mr. Deetken has successfully worked sulphurets for a number of years in Nevada county, professes to have obtained greater results than others engaged in the same occupation. Mr. D. has recently established himself in this County, on the San Bruno Road, rear the Islais Creek, where he has erected chemical and metallurgical works.

The German Bar Ledge--This famous ledge which was takeu up during the great excirement of 1851-2 and of the yield of which most astonishing reports were circulated, seems to have quite passed out of mind of late years, but has now been again brought before the public-as rich as ever. The Nevada Democral gives the following in relation to it :-
A Rtoh Srrike.-We learn that a rich quartz strike has lately been made in a ledge on the north side of the Middle Yuba near German Bar. The ledge is known as the "Copper Hill Lead," and is owned principally by Mr. George Fellows, who has beeu working it most of the time since 1851 . It was taken up during the quartz excitement of that year by a party of miners. of which Mr. Fellows was one, and the company, fortunately striking a rich pocket, took out from $\$ 150,000$ to 160,000 . Having worked out the pocket, it was found that the rock in other places would not pay, and the partners, one afier another, sold out or threw up their interests and returned to the Eastern States. Mr. Fellows, however, stuck by the ledge, and has been working it more or less ever since. He erected a mill some years ago, known as the "German Bar Mill," which was carried off by the flood of last winter. The rock, however, hardly paid for the expeuse of working, but he continued on, in hopes of striking another pocket, and his perseverance bas at length been rewayded.The workmen came upon another rich place a month or six wreeks ago, and have since been taking out gold by the wholesale. We cannot learn how much has been taken out, as Mr Fellows keeps thse matter to himself. He went below at the State Fair with $\$ 10,000$, which had been taken out within a week or two previous; since then the lead has been getting richer, and up to the present time there arenn indications of the pockets giving out. One gentleman, who visited the ledge a few days ago, and who has some means of judging, informs us they must have taken out nearly $\$ 100,000$ in the past month. Others place the amount at from $\$ 50,000$ to $\$ 100$,mont
000 .

A New Ciry.-It appears from the subjoined letter from the Morning Call of Monday, that a new city has recently been laid out on the west bank of the San Joaquin, at the point of its confluence with the Sacramento. It seems that the site possesses advantages, which will doubtless soon become known. it has already arrived at sufficient importance to call for the stopping there of the Sacramento Steamers fur way freight and passengers. We give the letter-

Collingsville, Oct. 25, 1862.
Editors Mornina Call :- You will receive this fiom our new city at the mouth of the Sacramente and San Joaquin rivers twenty miles (abont equal distances) from Suisun and Rio Vista, and opposite the towns of New York and Antioch. We have a fine wharf and store-house now bailt, and a good hotel. We are making a fine road from the wharf. Parties are about putting on a ferry boat to run to Antioch. The distance then will be only 35 miles to San Francisco, saving a distance of over one hundred miles, going by land and driving stock. A number of gentlemen from your city are now laying out our place in town lots, and we hope soon to have a post office, application having been made. The Sacramento steamers stop every other day-Saturday, Monday, Wednesday and Friday, going up; I'uesday, Thursday and Saturday, coming down. If you or any of your friends would like a few day's gunning, there is no other place in this State where game is so plenty. One of our gunners this week killed 164 geese in three shots. Our ponds are full of mallard and other ducks ; our tules full ot winter
snipe and larks. snipe and larks.

Preventing Incrustation of Steam-Boilers-Novel Application of Peat - The advantage of employing pure water in steam-boilers is too well known to require comment; and the processes by which it has been sought to remove impurities have been very numerous. Mr. John Cameron, of the Hematite lron-works, Hindpool, now proposes an extremely simple method of causing vegetable acids to act upon the impurities which have usually to be contended with. He forms a tank with two divisions, that may hold from $50,-$ 000 to 60,000 gallons of water; one division being on a lower level than the other, so that the contents of the upper division may be emptied into the lower. The upper tank is filled with water, and about 30 tons of peat is added to each 25,000 gallons of water ; the peat is put in part dry and part wet, and is occasionally stirred, that every part of the water may be acted upon. It is then left at rest, and the organic compounds (humin, ulmin, humid acid, ulmic acid, crenic acid, and apocrenic acid) existing in the peat precipitate the earthy matters contained. The purified water may then be drawn off into the lowfr tank, and the upper tank refilled.-London Mining Journal.

Batiles-During the Revolutionary war, there were fought thirty-six battles ; doring the war of 1812, eighteen ; during the Mexican war, twelve ; and in the present war thus far, fifty-three.

## THE EYES! THE EYESI! THE EYES!!!

## DR. E. H. PARDEE,

Oculist and Aurist to the San Fruncisco Deaf, Dumb and Blind Asylum.

After a protracted blindness of more than five years, Dr. PARDFE has made himself thoroughly and scientifically acquanted with all diseases of the Eye, and is now practicStates; and as proof of this he substantiates by many cases now in Oalifornia that have been cured by him, after having exhausted the skill of the eminent plysicians and oculists of New York city, Boston and Philadelphia.
From an extensive practical knowledge of more than 14 years, Dr. Pardee asserts, and is prepared to prove, that there has been more blindness from bad and improper treatment than from disease itself-how can it be otherwise when we take into consideration the effects of the old hacknied course of local treatment that patients undergo-Caustic to-day and Bluestone to-morrow-more painfal than death, and always more terious than the disease. Patients are duily presenting themselves with chronic cases, and on inquiring what had been formerly done, the almost invariable reply is, "I had my eyes burved with cantic or bluestone;" " I was bled and blistered, then cupped two or three times a week-had a blue pill prescribed for me at night, and salts in the morning-was ordered in a dark room-to keep my eyes tightly bandaged - to-avoid the open air and exercise," with fifty other inconsistencies the aggregate of which is sure blindness. Patients should be careful and not place their eyes at the mercies of a man who does nothing but bure them daily, not investigating the circumstances of each particular case, but ignorantly and blindly adopting and following theories the most erroneous, and destructive to the eye. How much more rational and consistent to consult an experienced Oculist, who thoroughly understands every disease of this tender organ in all its aspects and varieties. Dr. PARDEE has from sixty to one hundred patients under his daily supervision, and, with but very few cases, they have all beeo treated by other physiciuns hefore applying to him-and all to no benefit. Those wno are doublful are permitted to call at Dr. Pardee's office and confer with the many patients who couvene there between the hours of 9 and 12 in the forenoon. The Dr. has a large and only assortment of Artificial Eyes on this coast, inserted, having all the movements of the real eye, and that they louk so life-like that no one can tell them, when properly inserted, frcm the real eye. These eyes are sold reasonable.
All the operations performed, such as "Strabismus," or cross-eyes-"Cataracts"-or removal of the Lens by absorption or extraction;-" Plerygium," or fleshy membranes growing over the eyes. Artiticial Pupils, \&re.

## Onr Mint, its Rules, Charges and Operations.

In the columns of a contemporary we observe some ex ceedngly interesting statistics of mint matters for many years past, from which we glean the facts that the legal limit of wastage was $\$ 207,76699$ for the three years ending April, 1857, while the actual loss was $\$ 266,31286$, exceeding the limit some sixty thousand dollars. During the four years of Mr. Hempstead's Superintendency, the legal limit was $\$ 235,38639$; while the actual lost was only $\$ 4,52035$ being some ${ }^{W} 230,000$ less than the limit, and, in fact, a little under two per cent. of the amount allowed by law to be wasted. The wastage of the Philadelphia mint is twentytwo per cent., against two per cent., wasted by our branch mint. The total expenditures for thee years under Messrs. Birdsall \& Lott, amounted to the large sum of $\$ 1.019,275$ 39. Under Mr. Hempstead, the total exponditures fo: four years were but $\$ 1,150,64814$; while the difference between the last year of Judge Lott and the last year of Mr. Hemstead was upward of $\$ 100,000$ in favor of the latter. On retiring from the Superintendency, Mr. Hemstead left an unexpended balance of appropriation due the mint of up. wards of $\$ 86,000$. This certainly is a capital showing for our mint, and speaks well for Mr. Hemspstead's Superin tendency. Under Mr. Stevens, the present Superintendent, we have no doubt everything wil work in an equally satis factory manner.

For parting silver from gold when gold
is below $300-1000$ ths. fine. ...............3cts per oz.
" from $300-1000$ ths, to $750-1000$ ths fine. 7 cts " " Defosits Siluer Bullion-Purceases.
$\$ 1.21$ per standard ounce $1 / 2$ per ct. on gross value of all gold contained for coinage.
Refining charges (only where gold is contained) proportion of goid 1 to 300 , 3cts. per oz. gross weight 301 " 500, 7ets,

Deposits for Fine Bars
\$116-4-11ths cents. per standard ounce, 16 per ct. gross value of silver for making bars; also when gold is contained 16 per et. on gross value of gold for coining. Refining charges as in purchases.

Bars Sold From Refinery
$\$ 1$ 21cts. per standard oz. $1 / 2$ per ct. gross value to be ad ped for making bars.

Derostred for Dollars.
\$1 16-4-11ths. per standard oz. $1 / 2$ per et. gross value for coining, when gold is contained, refining charge the same as in purchases.

Deposited for Imported Bars.
\$116-4-11ths. cents per standard oz. $1 / 2$ per ct. gross value of deposit for making bars.
In regard to the deposits of Washoe silver, the rule will hereafter be, that the value of gold contained in the same will be paid in gold coin, and the value of silver in silver
coin. The value of the silver will be calculated at $\$ 1.21$ per standard oz, and is exempted from the coinage charge, unless deposited for silver dollars, in which case a charge of $1 / 2$ per cent. will be made additional. Bullion of the above denomination will be entered on the gold and silver register, as most congruous with the physical aspects of the material, but in the warrant it must be marked that so much is to be paid in gold and so much in silver, according to the con tents reported by the assayer. The above rules, and charges were promulgated on Jaly 10th, by Superintendent Robert J. Stevens.
U. S. Branch Mint, Nov. 6th, 1861.

On and after the 15 th inst., a charge varying in accordance and the character of the deposit, from half a cent to three cents per oz, gross, in addition to the general rates, and be imposed on all bullion deposited for coindge or manufacture, which will require toughening or extra refining to render it suitable for mint purposes.

Robt. J. Stevens, Superiatendent.

## SUGGESTIUNS ABOUT FOREIGN PATENTS.

American inventors should hear in mind that, as a general rule, any invention which is valuable to the patentee io this country, is worth equally as much in England aod some other foreign countries. Four patents-A mericau, English, French his discovery smong one handred millions of the most intelligent people in the world.
The facilities of business and steam communication are such, that patents can be obtained abroad almost as easy as at home. The majority of all patents taken out by Americans in foreign countries are obtained through the Mining and Scientific Press Patent Aaency. Having established agencies at all the principal European seats of Govern ment, we obtain patents in Great Britain, France, Belgium. Prussia, Austria, Spain, ete., with promptaess and dispatch.
Models are not required in any European country, but the atmost care and experience is necessary in the preparation o the specifications and drawingse
When parties intend to tak ont foreign patents, engravings should not be published until the foreign applications
have been made.
Cautron.-It has becone a somewhat common practice for agents located in England to send out circulars soliciting the patronage of American inventors. We caution the latter against beeding such applieations as they may otherwise fall into the hands of irresponsible parties, and thus be defrauded of their rights. It is much better for inventors to entrast
their cases to the care of a competent, reliable agent at home.
While it is true of Most European countries that the gystem of examination is not 80 rigid as that practiced in this country, yet it is vastly important that inventors should bave tbeir papers prepared only by the most competent solicitors in order that they may stand the test of a searching legal ex
amination; as it is a common practice when a patentee finda amination; as it is a common practice when a patentee finds
a purchuser for bis invention, for the latter to cause such exa purchuser for his invention, for the latter to cause suc
amination to be made before be will except the title.
It is also very unsafe to intrust a valuable invention to any other than a solicitor of known integrity and ability. Inventors shonld beware of speculators, whether in the guise of
patent agents or patent brokers, as they cannot ordinarily be trusted with valuable inventions.
A Circular containing forther information, and a synopsis of the Patent Laws of various countries, will be furnished on application to J. Silversmith, Goveroment House, San
Francisco.
Mesers, Miners, Inventors, Agriculturalists, Capitalist and Mecbanics, will find it to their advantage to subseribe for the Mining and Screntific Press-being the only journal of that class published upon this continent. Issued every ad at four dolars per annom. Address, J. SILVERSMITH,

CORNS AND BUNIONS REMOVED.
DR. BYRON C. K\&NNEDY, practical Chiropodist, late of Philadelphia, would most respectfully inform the citizens of San Francisco that he has opened his office at No. 12 Montgomery street, opposite the Lick House, where he is prepared to remove-alt excresences, such as Corns, Bunions, Inverted Nails, Enlarged Joints, Swelled Insteps, Frosted Feet, Chilblains, Callosities, and all diseases of the Feet, without pain or inconvenience to the patient.
Dr. Kennedy also attends to Ganglion, or Scorbutic Olcers, and all other diseases of the Skin. He may be consulted at his office, No. 12 Montgomery street, opposite the Lick House, from 9 to $12 \mathrm{~A} . \mathrm{m} .$, and 2 to 6 p. m. Having devoted six years of study to this important, bat too much neglected, branch of human knowledge, and having studied anatomy under the most skiiful and scientific Professors of Philadelphia, and having made this branch of surgical science my speciality for nine years, enables me to operate skil-
fully and successfully. In England, France and Austria the
highest prizes are often awarded to practitioners in this branch of surgical science, and it occupies with others an equally lofty position in the profession.

Voizin is an illustrious example, a shining light, among the philosophical stars of Europe, and Dr. Byron C. Kennedy has fully equaled him in this country, as a proof of which the Faculty of the University College of Philadelphia, Pa., complimented him with testimonials.
Dr. Kennedy has bent his earnest attention to the cure of these diseases, in which he has become so great an expert that be is now regarded as the leader in this country, in this branch of the profession, throughout the United States.
The following letter, which emphatically speaks tor itself, was written by Dr. W. L. Stevens of the University College of Philadelphia
Dr. Byron C. Kemany : Dear Sir-Learning that you are going to take your departure for Californa, and wishing to inform the citizens of Yhila-
delphia and also the people of the Stnte of California the esteem in which wo hold you, and knowing that nothong is more essential to your success than the encouragement which you may recevve from the people of Phila-
delphia, in the midst of which is the playground of your boyhood, and delphia, in the midst of which is the playground of your boybood, and
knowing that you have devoted years of siudy to this important but too much neglected branch of human knowledge; that you have attained to the
highest rank in your profession, sereral of tho Faculty and other prominent citizens of Pbiladelphia haviog, submited to your manipulation, we can recommend you with confidence to the citizens of San Frsacisco, as one of the most skilful surgeons of the age, and we hope your success may be such as
will repay you for your years of study, aud that you may find a broad feld or your exertio. sin the yew and growing city of the Pacife.

A Journal of minina, agriculture, manufactures, science, art, chemistry, inventions, mic.

## MINING AND SCIENTIFIC PRESS.

THR ONLY MYNLVG, MECHANICL AND SCLENTEEIC PAPER ON THYS CONTINRNT.

THIRD KEAR: VOLUME VI-NEW SERIESI A now rolumo of this extensively circulated paper commenced Sept. I1,
1802. It in intended that every number shull be roplete with information cotwerthe Mining, Ncientille, Jechnnical and industrial pursuits, together
with several original engravings, of nev fuventions, ctc, prepared exuressly With se wermal original engravings, of new luventions, ctc., prepared expressly
for ita columas.
Thin paper is devoted to the above purposes, together with the interest of simnce, arta, Agreculture and Commerce, and any general information
that may bu of uterest to the reader : and it is the intention of the proprio ior to quare no puas or expense in making it equal in interest and valuable
information to any paper yet published.

## The Mining Interest!

Will find it of great value, as it will contain all the news appertaining to
Niniug, the prices and gales of Siving Stochs, Dew iuveutions of Jachinery Miniug, the prices and sales of Siving Stocks, Dew iuveutions of dachinery aulap ere to
to the jfiner.

## The Inventor !

WIII Gnd it an excellent medium for the purpnse of bringing his invention into totice, of ascertaiuling the progress of iorentiou in this and other
countrics, and niso of receiving any information that nay be neceseary in obtaining bis patent, the proprictor haviog bad great exporience as a Patent Agent, together wit
ain Patents with dixpatch.

## The Mechanic and Manufacturer !

Will be greatly bencitted by its perusal, as each number will contann ser eral original engruvings of new machinos aud ioventinus, together with
large amount of rcading matter appertaining thereto. We are constantly receving the hest scienticic jourbals from all quarters, from which we
ghall coutuue to extract whatever may be of benefit or interest to our shall cont
realers.

To Chemists, Architects, Millworights and Farmers! This Journal will be invaluable. All new discoveries in Chemistry' will be giveln, and al large amount of informatinn of great service to Architects and
Sillwrights will be found in our columns. Tbe Farmers and Planters will nut be neglocted, engravings will be given of agricultural implements, and the farming juterest generally will be amply discunsed.

## Termas.

To mall subseribors :-Four Collars per snnum
Five Coples for Six Months. $\$ 8$.
Teu Copies for Twelve Months, $\$ 30$
Fifteen Copies for Twelve Monthe, 844.

For all clubs of Twenty and over, the yearly subscrintion is only $\$ 280$ Names cau be sent in at differcnt times and from diffrent Post-offices
Specimeu copics will be gent gratis to any part of the country. W, B. EWER, Publisher
Room 24, (formerly) U. S. Court Building, Corner of Washingten and Bat-

## Regarding Patents.

We desire to call the attention of all those who intend applying for Patents, to our superior facilities for obtaining the same. Our arrangements are such that we can have all the papers prepared, transmitted and returned, with the Patent Right, in three months from the time the applicant places the matter iuto our hands; thus saving at least three months delay.

The expense to the applicant would be rather less, if the business be done by us, than if the papers were sent to New York or Washington.

Thus by patronizing a home institution, our inventive citizens can save both time and money.

We have proinpt, intelligent and reliable agents in the city of Washington who attend punctually to all Patent business sent to them. We have agents, also, at London, Paris, Brussels, Hamburg, St. Petersburg, Berlin, Vienna and other European capitals.

## SCIENTIFIC CORRESPONDENCE.

The following ably written article is taken from the Washoe Times. T. B. Truckee is evidently well versed in geology and metallurgy, hence his interesting recital :
Mr. Editor-Dear Sir: Will you kindly admit a few remarks upon the subject of minerals and metals, into your valuable journal, which may not be unacceptable to your numerous readers?
The greatest matter of importance to this Territory, is the mineral wealth which lies buried in all its mountains, and the vast varieties in which it is found. It may be safely stated that this country possesses, in large measures, all the valuable known minerals; and, in a few years, this will become one of the most, if not the most, important region of the commercial world.
The question, in fact, is not, With what mineral does this country abound? but, really, What are the minerals which are not found in the vast mountains which form the eastern escarpment of the Sierra Nevada?
We find gold, silver, conper, iron, zine, mercury, antimony, bismuth, lead, arsenic, platinum, cobal, coal, \&c, in every variety of matrices ; all of which will, in due course of time be developed and worked. Tlin ore may be said to be the onty valuable mineral not yet found, but it may, nevertheless, be present as black tin, near some of
the lodes where copper has been obtained; although the lodes where copper has been obtained; although most of the copper ores, yet discorered, are associated with
gold and silver.
The metal to which the attention of the present popula
ion of this country is mostly directed is silver ; and the tion of this country is mostly directed is silver; and the
many and varied forms in which this mineral is to be found. many and varied forms in which this mineral is to be found importance to the commercial community of this part of the new world.
The mineral of silver has no less than trenty-six known varieties, viz: 1st, Native massive silver ; 2 2nd native nee-
dle silver; 3d, auriferous native silver ; 4th, antimonial silver ; 5th arsenical-antimonial silver ; 6th, telluric silver ; 7th, sulphuret of silver ; 8th, black sulpharet of silver; 9 th, fexible sulphuret of silver ; 10th and 11th, dark and light red silver blend; 12th compact silver glance, or vitrious sil ver; I3th, earthy silver gance; 14th, rhomboidal silve glance ; 15 th, white silver; 16 th, gray carbonate of silver 17 th, bismuthic silver ; 18th, maizyrite ; 19th, stromeyerite 20th, seleniuret of silver; 21st, eukarite ; 22d, iodide of silver ; 23d, carbonite of silver; 24th muriate of slver; 25 th, chloride of silver, and 26 th, butter-milk silver.

These varieties have their respective associated minerals, which may be placed as follows: Alumina, antimony, arse nic, barytes, calcium, cinnabar, cobalt, copper, gold, iron lead, mica, selenium, silica, sulphur; and tellurium.

Most of the silver ores of this country are very strongly impregnated with sulphur and arsenic, which substances render the obtaining the precious metal both difficult and precarious.
It has been the study of some years to endeavor to form some general principle by which the ores of the precious metals could be worked; bat to the present time it has proved wholly impracticable, as the features of every new mine differ, in some respect, from its neighboriag deposit and, therefore, little quack medicines, which are said to cure
all disorders, and are found to be failures in most, so in this instance, except the matrix be treated according to its constitution, a good and perfect result camot be obtained. In order to procure the finer and more precious metals, it requires that the impure qualities of the matrix should be either neutralized or expelled; and, in fact, the material treated according to its annalyzed constitution, without which it is quite impossible but that a very serious loss must always take place. This is tacitly acknowledged in all the works for the reduction of ores of this country, by the fact that every mill reserves its tailings for some future working.
It would occupy too much of your valuable space to, at present, enter further into this subject, but I will, with your polite permission, do so on some future occasion.

## I am, Dear Sir,

## Yours, faithfully, J. B. TRUCKEE.

Mairing Icfa by Macimeray.-The following is an account given in the World of a patent improved ice-making machive, manufactured by D. Siebe, Lambeth, London. This machine is in actual nse in India and Peru, where it produces ice at the rate at from two and a half to six dollars per ton.-The principle upon which the machine is constructed is an application of the well-known natnral law, that by evaporating fluids the caloric contained therein passes off with the vapor, thereby reducing the temperature of the evaporating body. In this process a volatile fluid steam is used as an evaporating arent; a powerful pump forms a vacuum, and in its efforrs to do so assists the evaporation at a low temperature on the one hand, and by prssure, with the assistance of water at an ordinary temperature, reduces the vapor again to fluid on the other hand, thereby using and re-using the same volatile fluid without loss. No chemicals of any kind are used, unless ether, benzol.4. \&c., are chemicals. Te talk about making ice in the United States may at first sight seem absurd. I am not so sure that it is so in all localities and under every condition of things. But there is a purpose to which this ice-making machinery is applied which may be deserving of attention in the United States.It is proposed to cool hospitals by this machinery on the converse principle by which buildings are warmed. It has been proved by experiment that this is practicable, the inside temperature of a chamber having been reduced to within six degrees of the freezing point, while the thermometer outside raged at $90^{\circ}$. Fehrenheit. In the progress of the war something of this sort may be very desirable. The machinery for making a ton of ice at a time might be carried on a large waggon.
Tron Formed by Animalcules.-The Journal de l'Instruction Publique contains a curious article by M. Oscar de Watterville, in which he announces the fact, not generalIs known, that in the lakes of Sweden there are vast layers or banks of iron, exclusively built by animalcules, not unike those that bave laid the fondations of large islands in the ocean, by silently and for ages cementing matter with matter, so as to create those beautiful forms known as ma-dre-poræ, mille-pore, corals, \&c. The iron thus fopnd is called in Sweeden "lake ore," distinguished, according to its form, into gunpowder, pearl, money, or cake ore. These irn banks are from 10 to 200 metres in length, from 5 to 15 broad, and from a fourth to three-fourths of a metre and more in thickness. In winter the Swedish peasant, who has but little to do in that season, makes holes in the ice of a lake, and with a long pole probes the bottom, until he has found an iron bank. An irou sieve is then let down, and with a sort of ladle, conveniently fashizned for the purpose, the loose cre is shoveled into the sieve, which is thep hoisted up again. The ore thus extracted is of course mixed with a
quantity of sand and other extraneous matter, which is got rid of by washing it in a cradle like that used by gold diggers. A man may get out a ton of iron ore a day by this process.

## IVORY.

The immense demand for eleplants teeth has of late gears increased its supply from all parts of Africa. At the end of the last century the annual average importation into England was only 192,600 lbs.; in 1827 it reached 364,784 least 3,040 male elephants. It is probable that the slaughleast is much greater, for thie teeth of the female elephants are very small, and Burche'l tells us, in his African travels that he met with some elephant hunters who had shot twelve huge fellows, which, however, altogether produced no more than two hundred pounds of ivory. To produce 1,000 ,000 lbs of jvory, the present annual English import, we should require (estimating ench tusk at 60 lbs .) the life of 8,333 male elephants. It is sald that 4,000 tuskers suffer death every year to supply the
A tusk weighing 70 lbs . and upward is considered by dealers as first-class. Cuvier formed a table of the mostremarkable tusks of which any account had been given. The largest on record was one which was cold at Amsterdam, which werghed three hundred and fifty pounds; in the late sules in London the largest of the "Bombay and Zanzioar"
was 122 lbs. of "Angola and Lisbon" 69 lbs ; of "Cape of Good Hope and Natal" 106 lbs .; if Cape Coast Castle, Lagos," etc., 114 lbs.; of "Gaboon" 91 lbs ; "Egyptian" 114. But it mast not be inferred from this that large tusks are now rare. On the cuntrary, it is probable that more long and century. A shoit time ago Julius Pratt \& Co. cut up at their establishment at Mer den, Ct., a tusk that was nine and a half feet long, eight inches in diameter, and which weighed nearly eight hundred lbs. The same frm in 1851 sent to the "World's Fair." London, the widest, Ginest, and largest piece of ivory ever sawed out. By wonderful ma-
chinery, invented in their own factory, they sawed out (and the process of sawing did the work of polishing at the same time,, a strip of ivury forty-one feet long and twelve inches wide. It took the precedence of all the specimens sent in by England, France, or Germaoy, and received rewarding at tention from the Commission.
It may be asked what can be done with such an immense piece of ivory? We reply that the time has come when this and we shall soon doubtless see tables, bureaus, writingdesks, and other members of the furniture family rendered as resplendent as the throne of Solomon. We believe that it is now contemplated by Steinway \& Sons to build a piano the African elephant, but an instrument whose whole surface shall be of burnished virgia ivory. One thing is certain, that any piano-forte manufacturer who should first attempt this will make a sensation by the novelty of the affair, and will donbtless be well rewarded for his labur.
The most costly tusks, or portions of the tusks, are those which are used for billiard balls. What are termed "cut points" of just the right size for billiard-balls, from $23 / 8$ to $35 / 8$ inches in diameter, brought the highest price (£53) per cut of any ivory offered in the London market at the late sales. Billiard-ball making has of late becon
portant item of manufacture in this country.
The teeth from the West coast, with the exception of "Gaboon," are less elastic, and less capable of bleaching, West coast tusks are much used for knife-handles. Since the French have possessed Algelia, France receives a considerable portion of ivory from Central Africa by the large caravans that travel from limbuctoo northward.
Ivory is also furnished by the walrus or sea-horse, and commands a price equal to the best qualities of elephant ivory. It is, however, too hard and non-e astic for many purposes, and has the disadvantage of being too small to cut up profitably.

Slle for fere Mlllion.-Some very encouraging experiments in the cultare of a new kind of silk, called ailanthine have been made in France under the patronage of the Em peror. The worm is an importation from China, where it The food of the worm is the leaves of the ailanthus. a har dy tree that flourishes equally well in the temperate or tor rid zone, and grows on soil worth little for any other pur pose. The silk is not so fine nor glossy as that produced takes most dyes well, and is emphatically a silk for the peo ple. Thus far the silk derived from the ailanthns worm has been what is known as corded silk-a material in great demand among manufacturers-but specimens of Chinese
manafacture show that they must possess some method of reeling off the cocoons. Says an English paper, in speaking of this new kind of silk, "To Henry IV. the country owes the silk of the rich ; to Napoleon III., courteous history Will record, she owes the silk of the people. In 1599, a great king wished to patronize the introduction of a terprise ; at the present epoch it is again a great sovereign who patronizes the introduction of a new silkworm, but it is
ingpossible that a minister could now be found who would repeat the error committed by Sully."

Effect of the Anerican War Upon England.-The loss Which England already sustains by the blockade of the secession ports can hardly be stated at less than a quarter of
million per week, including the cessation of employment and wages for the operatives, and the waste and loss of interest on capital sustained by the employers, in the staple manufacture of Lancashire. The localization of the interrupted industry adds terible weight to the severity of the blow.-
Jwo hundred thousand hands suddenly thrown out o work, in a population of twenty millions, might easily be fed and kept from severe suffering by the care and assistance of their immediate neighbors. But that number depived of their means of subsistence, in the midst of a popalation of
some two millions, all impoverished by the same calamity and most of them actualy dependent on the wages of those who are now unemployed, are in danger of actual starvation Some idea of the state of affairs in the manufacturing districts may be obtained from the report of a deputation sent from Birminghan into the cotton districts to make in quiries. In Manchester, the subscriptions to the general fund amount to $£ 25,000$, and $£ 10,000$ has been given to th Provident Socicty; while Liverpool, which merely imports cotton, and where only 1,000 or 2,000 cottou porters are dependent for a living by removing it from the ships into the warehouses, has already contributed $£ 32,000$. Exceptional cases are, however, uientioned by the Birmingham cieputa tiou. A large mill owner is stated to have lent his work people $£ 3,000$ to "tide uver the evil hour ;" and another has spent $£ 1,000$ in unproductiva labor. The Birmingham dep ntation culculate that the diminution of wages in the distressed districts during the coming winter months will be at least $£ 150,000$ a week, and the same authorities state that, when the distress has reached its hight, it will require adthe population from starving

Copprerng Them.-The Monitors, now in course of construction, have one weak point, notwithstanding the universal faith in their invulnerability Water will do that which hostile shot cannot-it will slowly but surely eat its way through the iron plates which compose the hull sa as to fatal-
ly weaken or destroy them ultimately. A method of copper ly weaken or destroy them ultimately. A method of coppe to afford effectual protection from corrosion. Copper is fused and heated to 1,000 degrees, when the iron plates which are to be coated are plunged into it and kept there until they are nearly at a white heat. Then partial fusion between the two metals takes place, and the plates when withdrawn are the galvanic process which has hitherto been employed.

A Poterfol Ram.-The rebel ram, Fingal, building at Savannah, will soon be completed, and when her iron-plating is finished she will be fully equal in point of strength to the
Merrimac. She was an Euglish iron steamer, and ran the Merrimac. She was an English iron steamer, and ran the stronger than ordinary vessels, being iron-braced in every part. She was built in Greenock, in England. The rebels have cut this vessel down, razeeing her some eight feet. and widening her by the introduction of eight teet of white oak on eilher side, bolted on, and the iron planting is bolted and riveted to this. The whole vessel is roofed over with iron, on the same principle as that evident in the construction of the Merrimac. She is provided with eight hundred horsepower, double oscillating engines, and will be a troullesome customer, if she is ever allowed to get out from Savannah.

What Iron-Clad Ships Have Done.-The Liverpool $P$ ost says:-In a short time, the war continuing, America will have the largest and most effective navy in the world The Government at Washington does not yet feel quite se cure against the chance of European interference. Possibly the alarm of intervention is encouraged to sustain the
military ardor of the nation under present circumstances; for it is dificult to suppose that any sane man could believe for a moment that England would interfere in the present quarvel otherwise than in a friendly spirit. Hereafter there can be no war between an Kuropean Power and the United
States. Iron-clad steamers forbid it.
New Mode of Catching Trolt.-Sevi Bartlett describes in the Country Gentleman some trout ponds on the farm of mode of feeding. Last winter, after the poods had frozen over, he states that a boy was sent to feed the trout with chopped meat. Having cut a hole through the ice and put in the meat, the boylay down with his face near the water
to watch the fish, when a trout grabbed him by the nose, and the boy by a suddenjerk of the head, threw the fish upon the ice. He thus obtained a trout of thres-fourths of a pound weight, but at the expense of a sore nose for three

Sours of Acids.-The sourness of the juice of a lemon and the acidity of vinegar are so well knowu that the mere mention of them is sufficient to convey a knowledge of the chief qualities of sours or acids in their natural state. There are so many acids that two or three pages of an index to a themical book are taken up in enumerating them. Every fruit contains an acid; nearly all the minerals are capable
of forming acids. When coal, wood, paper, rag, charcoal, brimstone. phosphurous, and many other substances are burned acids are produced. 'A flint stone is an acid. There is an acid in our window glass, and in many of the mogt costly precious stones. The air we breathe contains an acid. We create an acid in the lungs by the act of breathing.-
By a very slight change sugar can be converted iuto oxalic By a very slight change sugar can be converted iuto oxalic
acid, which is a strong poison. Sugar by another change, is converted into vinegar. These two illustrations show that a sweet can be converted into a sour; but when sou fruit becomes sweet it proves almost to demonstration that a sour can become a sweet acid
The most powerful acid is that derived from burning sud phur-it is called sulphuric acid, and is one of the mist important articles-of mauufacture. Its acidity is so great that a tea-spoonful is sufficient to make a pailful of water quit sour. Niti ic acid obtained from niter, or saltpetre, is of the next importance in the arts; it is socorrosive that it has long been distinguished by the name of aqua fortis, that is strong water-strong, sure enough for a nodule of iron, lead or silver, dissolves in it like sugar placed in water. From the number of acids which we find in nature, and the ten dency of many artificial substances to become sour, it is evideut that acids and sours are essential to our life and well being. I Acids assume all forms and colors; some are liquids, some gaseous, others solid. The acids of fruits when separated from the grosser particles that accompany"them, are very beautiful and crystilizable substances. By the in genuity of the clemist the sour or unripe apples, grapes tamarinds, lemons, \&c., may be charstilized into beautiful snow-white bodies, which, howerer, when tonchea by the tongue, at once indicate their oi igin by their flavor.

The New Metal Thallum.-This new metal, which was discovered by William Crooks, of London, has lately been described by the discoverer in the Chemical News, and preparations of it have been placed in the Gruat Exhibition.Thallium, in most of its physical properties, resemblis lead It is not so white as silver, but whon freshly cut, it presents a brilliant metallic luster. It is soft, malleable and easily cut with a kuife, and it marks paper when rubled upon it leaving a yellowish streak. It has a great tendency to crys talize, und ingots of it crackle like those of tin when bent To flame it communicates a deep green color ; and in the spectrum, according to the researches of M. M. Bunson and Kirchoff, its single green ray is as sharply defined as the yellow ray of sodiun. Thallium rapidly tarnishes in the open air, and it becomes covered with a thin pellicle of oxide which, like the oxide of tin, preserves the rest of the metal from oxidization. Its oxide is soluble, alkaline in its nature and it has a taste and smell similar to potash. Sulphuric and nitric acids dissolve it under heat, and it burns in chlorine gas heated to $200^{\circ}$ It exists in many of the pyrites that are used in the manufacture of salphuric acid.

Three inventions have appeared lately that will, perhaps, ultimately revolutionize those branches of industry they are designed to effect. One is an engaving machine, which produces on steel designs from surfaces, either flat or in relief, with marvelous fidelity. The second is a spiral trowel, which when attached to a plowshare, cuts a round hole, so that, in a few hours, a permanent drain is formed-the processes of
plowing and draining going on simultaneously. The third is a trifle, but a useful tritle. It is a match which cannot be ignited by any species of friction, nor by fire itself, but only by being rubbed against the box prepared for its reception, which is coated with the flame-giving property.

Manuracture of Shot-The Dubuque shot tower hav ing been purchased and closed up by a St. Lonis house, in order to remove its competition, the citizens of Dubuque became indiguant, and commenced experimenting to mak shot by dropping metal down the deserted lead mine shart, and with the most satisfactory results. They are now going into the business quite strongly, having decided that there is
no necessity for building fifteen thousuod dollar towers, when a hole in the ground, with an expenditure of $\$ 500$, will do as well.

Two Ways of Fiseing.- Rev. Dr. Bellows says that when men go a fi hing for trout they take a light, tapering pole, with a fine silken line attached, and a sharp hook with the line on the water and let it float to the fish, which nibbles, and by a slight twitch is landed safely on the bank.But when men go fishing for souls, they tie a cable to a stick of timber, and an anchor is the hook. On this a great chunk of bait is stuck, and with this ponderous machine grasped in both hands, they walk up and down thrashing the
water, and bellowing at the top of their voice--Bite, or be damutd.

Tap purest metal is produced from the hotest farnace, and the brightest thunder bolt from the darkest storm.

## TO MiNING COMPANIES.

We earnestly solicit from rining companies and associations the fullowiug blank statement, filled according to the data hereby accompanying. The purpose for which we seek this information is important to every citizen and stockholder on thit coast ; it would also be prodnctive of benefiecial results- $i$. o., inducing capitulists to invest in our miniag oporations, thereby infusur new life and vigor into business generally in our States aud Territories, Little, if anything, is known of our metallic wealch in Europe or the Linsterin States, hence we desire as much of the blank filled by you as may be interesting and instructive to the people of this State and those interested abroad.
We knoss of no mining district in Europe or America where this kind of infirmation is not willingly rendered by parties owning property of this nature ; and we know of fu better medium for making public the richness of our mines. We shatl sund blanks to mine and mill proprietors for every quarter, and will gladly publish the contents for the iuformation of the community:

## Incorporated Mining Companies.

The furor for incorporating Mining Companies under the Laws of the State of Califurnia, seems to ve on the increase, and not a day passes that some Company with a nominal Capital, ranging from $\$ 100,000$ to $\$ 500,000$, is not Incorporated, by some of our Courts. Although hab.e to abuse, this is undoubtedly the best method of working and man. aging the financlal affairs of a Mining Company, as it facilluates business, enables parties interested to buy and sell, or borrow upon their interest in the mane, and in various other ways brings uadoubted beneits with it. The 'modus opeiandi" is simple and as follaws : All the parties interested in a Ledge or Claim, being desirous of forming a Joiut Stock Company, meet and adopt a vame and a cude of by Laws for the new Company. 'I hey then prepare in due form a Certificate of Incurporation, which sets forth the intention of the parties, and the names of the 'rrustees of the company, this, being signed and acknowledged, is filed with the Clerts of a Court of competent Jurisdiction, aud a certified copy sent to the office of the Secretary of state, after which a trust deed of all the right, title and interest of each of the parties owning in the miue is slgned, acknowledged and recorded, conveying to the Company all theiir interests in the mine. The proper officers are theu elected, the books opened and stock issued. Then the Institucion is fairly af float, on the tide, either to become a permanant, paying fixture, or to subside and die suddenly ou
For the facilitating of business, the collection of assessments, and the general system of conductiog the afiairs of a Company-there is nothing like an Incorporation: But the great trouble with it appears to be, that the mivers of Nevada Territory (where the principal Incorporations have been effected) have conceived the erroneous idea, that the simple form of issuing stock must necessrrily give value to the nine it represents-losing sight of the fact, that, stock of any kind which does not pay dividends, is substantialiy valueless.
The mines of Washoe have now been open long enough for them to commence paying their owners, and with proper management, there is not a developed mine in the Territory that could not be made to pay dividends, which, however small, would serve to renew the confidence which is now beginiug to wane in Incorporated Mining Companies.

Canadian Petroleum-Its Origin.-The Canadian Journal of Art asserts that Canadian petroleum is not derived from coal, nor is it of recent origin. It says :-

Petroleum was formed long before coal, and is the result of the decomposition, under pressure of an infinite number of oil-yielding animals which swarmed in the seas of the
Devonian period, long anterior to the coal. The decompoDevonian period, long anterior to the coal. The decompo-
sition of marine plants may have given some oil to the rocks of Canada and the United States, which are saturated with this curious substance. The shale beds of Collingwood furnish an answer to those who object to the infinite number of animals it would require to produce the oil locked up in the earth. Those shale beds arecomposed altogether of the remains of Trilobi:es-they extend from Lake Hucon to Lake Ontario, and far west and east of these lakes. The oil-bearing rocks of Canada were once a vast coral reef, extending from the Gulf of Mexico to Lake Superior. There is the best ground for belief that the supply of oil will last
for a long period, and thatnew discoveries will be made in for a long period, an
different localities.

Another Asteroid was discovered by Henry M. Parkburst, at New York, on Sept 25. It-is in the constellation
$P$ isces, and is of the eleventh maguitude.

## MONEY NOT WEALTH.

A correspondent has furnisheḑ a communication controverting the leading article in the "Scientific American" of November 8th, which appears under the title of "The Gold Mines of California of No Value to the World." Our correspondent characterises the article in the American as "ridiculous leasoning." If our friend will carefully re-examine the same he will find that the only proper application of his term to the article in question, is to the impropriety of its heading. Of course, the proposition that "Ihe Gold Mines of California" are of "No Value to the World," is ridiculous in the extreme. But the American, after aunouucing the above proposition, immediately loses sight of it and proceeds to discuss the very different proposition that "GoldMining, provided the metal is used for coin, adds nothing to the wealth of mankind." This latter proposition, we apprehend, our correspondent will admit is correct, and incontrovertible. Guld, when "used for coin" may be a valuable auxiliary in the transaction of business, as a representative of wealth-but no amount of gold, maanfactured into coin, can add as much to the value of the wealth of the world as a simple plow made of iron. The following which we quote from the American is correct reasoning, in the main :-
If a man owns a steam engine worth ten thousand dollars,
the engine forms this portion of the wealth of the world.the engine forus this portion of the wealth of the world-And if the mau devotes his surplus labor, besides that which is necessary to procure a living, or expends his surplus profits in constructing a second engine of equal efficiency and
value, he adds another ten thousand dollars to the wealth of value, he adds another ten thousand dollars to the wealh ol labor or profits in simply adding to the weight of his engine, withoui increasing its efficiency or usefulness in any respect, he does not by the ope:ation augment the wealth of himself, of the community or of mankind. In complex states of society, the innumerable exchanges of property which people mutually desire to make, are effected through the medium of money. The articles which first came int.I use as money were the more valuable metals. As civililization advanced, and the organization of society became more complex, certain individuals and associations exchanged their notes, promising to pay either gold or silver or plainum on the presedlation of the note, aud these notes also came into use as money, being received by persons in exchange for articles of value on the faith that the stated quantity of valuable metal could be obtained for them at any time. The money in circulation in this country amounts to about two per cent of the whole wealth of the country. Now the point that we
make is, that this proportion (of tivo per cent) will not be make is, that this proportion (of tivo per cent) will not be
altered by doubling the amount of mosey in the world ; for altered by doubling the amount of mosey in the world; for
prices will advance so as to double the nominal value of other property, and thus the prupotion will be maintained.
"The Gold mines of California" have proved valuable auxiliaries to the increase of the wealth of mankind within the past twelve years. The addition of the $\$ 700,000,000$ which they have given to the "circulating medium," has produced an impetus to commercial and mechanical pursuits which is truly astonishing. They have failed, as we think, to increase the percentage of wealth in proportion to the increase of the percentage of the "circulating medium," as, in the opinion of the American, must be the universal law of the increase of coin; yet they have done better than that-the facility which they have afforded by their increase to a reliable circulating medium has so stimulated all branches of business, and in such a healthy manuer, as to greatly increase the proportionate weallh of the world to its proportion of circulating medium. In all this, however, in far as their yield has been converted into coin, the "Mines of Calfornia" have added nothing to the actual wealth of the world. A coined dollar of California gold is simply a repre sentative of a certain amount of wealth. Destroy its value as a representative of that wealth, and it will be sought after no more earnestly than will its equal weight in iron.
Coal Oil for Drilling Glass.-A correspondent of the Scient fic Amevican says that the best lubricating fluid for drilling glass or very hard steel is coal oil. The direction is to merely wet the point of the drill with the fuid when it is found to give the instrument a better "bite" than anything else. The correspondent says he has thus drilled into the edge of common window glass to the depth of an inch, ing a drill one forty-eighth of an inch in thickness. The glass is not so apt to flaw, or break, as when other substan ces are used.
The finest features of the face are chiseled by the mindas the latter becomes cultivatad and refined, the former becomee more and more beautiful.

Imports and Exportso-The Currency \&uestion.
Our imports, during the nine months preceding Nov. 1st, have been only about $\$ 30,000,000$ in excess of our exports; yet our exports of specie have reached, during the time, the high figure of $\$ 45,000,000$. The balance of trade has but litthe to do with this extra outllow of gold. This excess of specie shipments is due in part to the large transfers of capital which are now being made for investment in foreign stocks, but mainly to the present depreciated condition of our currency. This currency depreciation has increased the rates of foreign exchange about 30 per cent, which, in effect, is equivalent to an export tax of that amount on all produce and manufactures shipped to foreign ports. Our exports the current year are estimated at about $200,000,000$. The present high rate of exchange; therefore, is equivalent to a direct tax of $\$ 60,000,000$ on our exporters, or, indirectly on the consumers of imported goods. This is the annual rate of amount which onr people are now paying as a consequence of our prisent disorgauized currency. The burden might be borne more resignedly, if that amount were being paid into the National Treasury-but when it is borne in mind that this large sum of money goes in to foreign hands, and to that extent di. ectly impoverishes our people, the fact calls loudly upon the incoming Congress to devise some means to remove this great burthen from the nation. Congress can undoubtedly accomplish such an act, without oversteping its constitutional limits.
It has been suggested that the end desired may be reached, or at least very closely approximated, by the Government simply confining itself to the paying out of Certificates of Indebtedness, only instead of Demand Notes, which, when paid in, should be retained and destroyed. This, w.th a vigilant and econemical prosecution of the war, with a view to its speedy termination, would, no doubt, greatly reduce the premium on gold, and, to that extent, relieve the people of the present indirect system of taxation in favor chiefly of a Power which entertains but little sympathy for the Cause of our National Unity. The people earnestly demand some action in this matter.
The Height of an Ocean Wate.-It was prophesied that Mir Brunell's first ship, the Great W estern, would be doubled up as she rested on the crest of the Atlantic wavts; and we all know how the prophesy was fulfilled. When it was made, indeed we were very much in the dark as to the size of the ocean waves. and it was not until the introduction of long steamers that they could be measured with any accuracy. Dr. Scoreshy, while crossing the Atlantic in one of the Cunard boats, some years since, closely observed the waves, and by means of the known length of the ship, was enabled to form a pretty accurate idea of their dimonsions. The old vague account of $t$ eir being mountains ligh was well known before that time to be an exaggeraion; butwe do not think that even philosophers were prepared for the statement made by this observer, at a meeting some years since, of the British Association, that they averaged no more than twenty feet in altitude, and rarely exceeded twentyeight feet.

Ocean Highways--Persons who do not pay special attention to nautical matters, are likely enongh to suppose, that considering the large number of vessels at sea, the surface of the great ocean must be dotted over, almost in every part, with the sails of the countless fleet. This, however, is not the case; the ocean. like the land, has its frequented highways and its wide regions of loneliness, If an observer, furnished with a forty-Herchell telescope power of vision, could be elevated to a height great enough to give him a view of the whule Atlantic, he would be struck by beholding hundreds of vessels following one another upon certain lines along a very irregular course, while over a very large portion of the surface not a sail would be visible. In the exteusive spaces on both sides of these "Ocean Paths," few vessels will be seen.
Map of Netada T'erritory.-Warren Holt, Esq. has just issued another splendid map of Nevada Territory, compiled and drawn by Dr. He ry Degroot, the editor of the Virginia City Times. Thus far no better map has appeared and its sale has been extensive. It appears to contain every place and district of note and is executed on copper plates and colored. It will prove valuable and instructive to those interested in that quarter.

## A New Amalgamator.

The Miner's Foundry, of this city, has been for some weck; engaged in casting and fimshing of a number of a malganatius pans or tubs, un a new principle. They are the invention of Mr. Zenus Wheeler, furmerly of Cruss Valley, Nevada county, and will bo known as "Whecher's Amalgamatons." They may be used for bo higold and silver. One principle involved in this invention is that the amalgamatiug and triturating is done in one set of tubs or pans, and the separating (of the quicksilver and amalram from the sand) is accouplished in another. A set of these pans was constructed at the above foundry and forwarded to the Zephyr Flat mill, on C'arson river, owned by Messrs Raymond it Thomson, ahout three months since, where they have been runniug, side by side, with the pans in common use, and operating apon a common vat of sands from the mill. The differeace in the yield of the two classes of pans, as we learn from several letters from the proprietors and agents of the mill, which we have been ullowed to examine, has been from 20 to 30 per cent in favor of the Wheeler pan. This percentage is certainly very large, and we should hesitate to give it were we not able to do so upon the authority of the owners and agents of the mill, who have no other interest in the invention than the providing of the most efficient process for saving the mineral from their ores. The ore upon which the mill i* rumning is the 3 d class Ophir ore, a large gquantity of which has been sold by the Ophir Company to Nessrs Raymoud \& Thomsou. These geatlemen have shown their confidence in the Wheeler pans loy ordering eight more of them, ( $a$ full compliment for the mill.) The order has been filled as above, and the pans are already at the mill and will soon be at work. Mr Wheeler has secured a patent for his invention. We shall give an illustration of it next week, or the week after, and a fall description. We trust this invention may prove to be all that it is represented. Every invention tending to improve our mining facilities adds matorially to the wealth of our State by increasing the yield of her mines.

Machines and Devices for the Reduction of Ores.-It seems from present appearances, that most Mining Associations, throughout this State and Nevada Territory, are doing very little in the working of ores except by the modes heretofore employed, and in the latter district they are falling back upon Mexican and German processes. A most happy omen has manifested itself, namely: that when a professional quack arrives with new processes, he is viewed with suspicion and distrust, hence their operations are limited and short lived in that quarter. Our stamp mills as constracted by the different founderies in this city, seem to fully answer their intended purpose. An innumerable number of pans for amalgamation have, of late, been pre. sented to the miniug public, many of which are employed with great advantage, and form, at present, the chief utensil in Washoe for extracting silver and gold. The Freiberg barrel process seems, however, to gain over all new fangled notions, a few of the leading companies having adopted this mode already.

The latest discovery announced is that of a smelting furnace on an entirely new principle-the oxygen of the atmosphere being the chief or only fuel employed. This invention is designed to do away with all reduction works and extract the ores by smelting alone. The inventor is a lady, Mrs. E.J. Hall, of this city. We have in our office the result of the last attempt to put the invention to a practical test. It was tried upon copper ore, with but partial success. It is clained, however, that the failure was caused by an improper coustruction of some portion of the furnace, which cracked during the progress of the experiment. We are told that another trial is to be made soon. Whenever any successful and practical result is attained we shall be happy to announce the same and do what we can to bring the invention into notice and use.

Grain Shifments.-Large quantities of grain and flour are now being shipped from New York to Europe. During the week ending October 17th, there were thus shipped from that port, $1,140,750$ busbels of grain, and 40,138 barrels of flour-in addition a general assortment of other provisions.

## Metallurgical Treaiment of Pyriteg.

No mining district or enuntry ontside of Mexico and the South-Amer can stutes, has ever furuistued a greater field for the extraction of preciuss metals from I'yrites, than this Siate and adjacent Territory. Comparatively few have even succeeded iu making this branch of industry puy, uring to immense expenses, time and labor required in treatiog minerals of this nature ; and at present, only Pyrites containing a groodly portion of gold, will pay to work. It may be safely estiouated (although many reducing establishments concentrate their sulphurets or pyrites) that, perhaps millions of dollars are allowed to float and pass through the tail-races and streams, in a year. The metallurgical treatmeat of prrites is one involving great chemical skill, and can ouly be undertaken by persons of experience. Although many general processes for the reduction of ores have heretofore failed, yet a universal method for treating pyrites has of late been patented, which works successfully, and greater results have been obtained by this process, than by any other method heretofore known. A short distance from this city, on the San Bruno road, may be seen a newly constructed edifice, containing a reverberatory furnace of considerable capacity, several vats, from 6 to 8 feet in diameter and from 4 to 5 feet deep, metallic gas generators, together with much chemical aparatus, and paraphanalia requisite in a well established metallurgical work. The process which this enterprising proprietor employs bas just been patentid and is known as the Hydro-chloric process. In a former editiou of this journal we gave a description of the modus operandi. Many mill awners and mining companies have made arrangements with this establishment for the reduction of their sulpburets, and shipments arrive constantly at the works, which are not far from a landing on the bay. The gentleman who has erected these works is Mr. G. F. Deetken, who has had years of experience in this branch, he has also adopted expedicious plans for concentrating the sulphurets or pyrites, and he shortly anticipates to contract for their pyrites, with all the mills in the State, either purchasing the same at the assay value, or reducing the same for a stipulated percentage., It may be safely stated that from 20 to 30 per cent more of the gold nay be gained, than by any of the amalgamation processes.

Pressure of Steam in Bohlers.-A pamphlet has been published in England by Mr. Anderson, the well known machinest, on the managenent of steam boilers, in which he says that the pressure within a steam boiler is greater than is generally supposed. With a pressure of fifty pounds per square inch, it amounts to 7200 pounds on every part of the surface exposed to the steam, amounting frequently to many thousand of tons in the boiler, thus accounting fur the enormous havoc made by explosions. The joints are weaker than the solid parts; gond solid plate will withstand from 56,000 to 60,000 pounds per square ineh of sectional areathe joints will give way at about 34,000 pounds, which shows the importance of seeing that the rivets and other fastenings are always in sound condition. Mr. Anderson divides explosions into four classes, namely, from want of strength, deficiency of water, heating of plates, and a variety of other circumstances.
The Twinkling of the Stare.-According to M. Arago, astronomers and others have failed to arrive at a satisfactory explanation of the twinkling of the stars on account of their failure to give an exact definition of the term scintilation. He affirms then, that, in so far as naked eye observers of the heavens are concerned, scintilation, or twiukling, consists in very rapid fluctuations in the brightness of the stars. These variations are always accompanied by variations of color and secondary effects, which are the immediate consequences of every increase or dimunition of brightness; such as cunsiderable alteration in the apparent magnitude of the stars, and in the length of the diverging rays, which appear to issue in different directions from their centers. It has been ramarked from a very early age that the phenomena of twinkling is accompanied by a change of color. It is asserted that the name of Barakeach, given by the Arabians to the star Sirius, signifies the star of a thousand colors. M. Arago also asserts that ihe planets twinkle.
Tye less a man knows, the wider his mouth opens. It is as impossible for a fool to keep his jaws shut as it is for a sick oyster to keep his shell closed.

Delay.-The delay of our present issue has been unavoidable in consequence of the necessarily prolonged absence of the editor, to so arrange his business in the mountains that he might hereafter devote his antire time and energics to the management of the Press. This has now been accomplished, and he can promise the prompt and regular issue of the paper hereafter. Some weeks may elapse before he will be able to make it what such a paper should be; but, by the promised assistance of friends he confidently hopes, ere long, to render the Mining and Scienlific Press a welcome and valuable weekly visitor to the miner and mechanic, the inventor and maunfacturer, and indeed to every one in pursuit of useful and practical knowledge in every department of life and indostry.

Iron Clads and the Federal Nayy.-There are at the present time not less than 384 ressels of all classes built and being built for our navy. Of these 13 are iron clad, now affloat, and 40 -mostly gunboats, in process of construction. When these are a'l completed we shall number about 40 iron-clads-a number nearly equal, and quite as effective as all the other iron-clads of the world combined!
Equalizing the Sexes-At the outbrealz of the present rebellion, as appeared by the census of 1860 , there were 730,000 more males than females in the Union-a fact unprecedented in the bistory of any other civilized nation.The war, however, is fast equalizing the sexes.
A full and particular account of the Grass Valley Silver Mines will be given in our next issue.

## Important Publicaiton.

We have been favored, by the publisher, with the title page and prospectus of the quarto work entitled, "The Metalic and Agricaltural Wealth of the Pacific States." The editor of this work has recently disposed of the "Miaing and Scientific Press," with the riew of devoting his antire attention to the publication of the work; to this end he is making arrangements for an early visit to the Atlantic States and Europe. The work if carried out according to the prospectus, will be one of the most valuadle publications yet presented to the public, and will prove of incalculable bene-
fit to California and the Pacific Coast generally, in bringing the immense mineral wealth of this region more prominently before the Capitalists of Europe. The object is a laudable one and ought to be encunraged. Mr. Silversmith is one of our oldest citizens and is well acquainted with the sub-
jects of which he treats. He desires but little aid and that we trust he will readily obtain. The ftllowing is the frospectus :

## PROSFECTUS TO THE FEOFLE OF TEE STATE OF OALIFORNLA, OREGON, AND ADJSCENT теrratosies,

The Salscriber, one of your earliest ciftizens of California, and for the
most of bis time engaged as a journalist, aud particularly of tate in a jourmost of his time engaged as a journalist, aud particularly of late in a jour-
nal deroted to the clief resources of the Pacific States, respectfully submits the following plan and proposition for the purpose of brivging hither from
England, France and Germany the workivg classes, mechanics, artizans. miEners, and metallurgists for the purpose of devel oping the resources of our thiniy populated Staves and Yerritories, thereby reducing labor, the estabnow lying dormant, and to worls our mines. The benebits accruing to our Government-to marioe conseyances-the merchant-the manufacturer,
the mining compantes and profesional community, canvot but be beoeficial, provided the facilities are offered to such emigrants, and according to the tonor of our laws gorerning such. For these purposes the subscriber de-
sires to seek only the necessary or pecuniary nid to take him across the Pacific and Atlentic, so that he may be enabled to lay before the people of Europe a work which he has compiled from authentic sources, comprising the Culifornia, British Columbin, etc., logether with a synopsis of the climatology, agriculture, arts and manufactures, with interesting statistics of our
imports exports, and population. Also, the orranic acts of our state, the local and general laws governiog miniug, the Pre-cmptios Act, and kindred subjects pertaiaing to the Pacigic States. The au. Lor reserving for biwself the right of translation of this work (which has cost him three yeurs of his time to collect and compile) in the German and French laugaages.
Ho contemplates making the tour to the Allantic States and Europe in February or March, 1863, and will equip limself with the mineral materi-
als, fossil remaing, etc., and illustrate them oy diagrams and discourses throughout the Alladtic sitates ado Europe.
Such a work which your petitioner bas io view cannot be published in this State without an extruordinary outlay, oor have we the maternus, ar.
tists or skill in copperplate or wood engraving. The work will comprise tists or thall in copperplate or wood engraving. The work will comprise
from 400 to 500 pages, to be handsnmely illustrated with colored phates, maps, etc., quarto form. The subecriber will add thereto a complete list of all the associations and compunies, especially midng compuries.
He gues to Europe for the purpose of seeing all the manulacturing places, machines and utensils; also to the feading mining districts and metallurgical establishments, to acquire from the best sources there the best
mode of treatrag our rich minerals, aud lay these several importaut feat ures bofore our peoplo through the Mining and Scientific Press, and the work he hereby offers, But the most important subject in his mission is the inducements he will offer to Eurupeans of our immensely rich minng Gelds and agricultural lands, togetber with the great advantages offered by a liberal and protective govermment for industrious citizens.
The subseriber, therefore, calls upon the clitizens in the Pacific States who have the interests of our new states nearest their heart, to aid him in
th is gravd but laudable urdertaking with means. Each subscriber will be furvished with a copy of this work, which is designed to be useful in the tounting house, to the professiopal man and miver. The author desires to state that whatever aid or subscriptiou he may be furnished with by the
people of this State he wiil refund atter the publication of the wort, or

## leave the amount to be taken out in bouks.

## Respectfully submitted,

JULIUS SILVERSMITH.
The Spider.-This sprightly little insect, usually so much dreaded, is as cunning and courageous, as he is watchful and active. He never hesitates to give battle when his in clination tends that way, and is prompt in his own defense when attacked. But Mr. Spider's morals are not of the best quality, and his voracious appetite sometimes leads him astray ; for instance the male will frequently make a meal of his progeay, and highly relish the dish; but this is not always a safe operation, as the female is more affectionate, and loves them tenderly; andif she cannot save them in circumstances of peril, she prefers to perish with them.-
The love which she bears to her little ones, she does not alThe love which she bears to her little ones, she does not al-
ways extend toward her mate; but sometimes, after having in vain attempted to prevent him from devouring her offspring, she chauges her tactics, and acting on the idea that a canni bal may himself be fit for food, she falls upou him-conquers
him, and eats him up.

What is Itret?-Old Dr. Cooper, of South Carolina, used to say to his students, "Don't be afraid of a little dirt, young gentlemen. What is dirt? Why nothing at all of
fensive when chemically viewed. Rub a little alkali upon that 'dirty-grease spot,' on your coat, and it undergoes a chemical change and becomes soap. Now rub it with a little water, and it disappears; it is neither grease, soap, water, nor dirt. 'That is not a very odorous pile of dirt,' yon observe there. Well, scatter a little gipsum over it and it is no longer dirty. Everything you call dirt, is worthy your notice as students of chemistry. Analize it! It will all separate into very clean elements.
"Dirt makes corn, corn makes bread and meat, and that makes a very sweet young lady that I saw one of you kissing last night. So after all you were kissing dirt-particularly if she whitens her skin with chalk or fuller's earth.There is no telling, young gentlemen, what is dirt. Though I must say that rubbing such stuff upon the beautiful skin
of a young lady is a dirty practice. 'Pearl powder,' I think is made of bismuth-nothing but dirt."
Ancient Doctors.-Mayerne, a French physician, who is said to have nambered among his patients two French and three Euglish sovereigns-Henry IV. avd Louis XIII. of France, and James I., Charles I., and Charles II. of Eng-
land-was fond of dosing his patients with "pulverized human bones." A chief ingredient in his gout powder was "raspings of a human sliull urbmried," In the composi-
tion of his celebrated "balsam of bats." he enployed "adtion of his celebrated "balsam of bats." he eloployed "ad-
ders, bats, sucking whelps, eari hworms, hog's grease, the marrow of a s ag. aod the thigh-bone of an ox." Belief in the efficacy of charms and amulets was once universal with the faculty, and precious stones were regarded as sovereign remedies. The lyyacinth and topaz hung about the neck or taken in dink, were certain "to resist sorrow and recreate
the heart." The sapphire was "a great enemy to black choler," and was believed to "free the mind and mend manners." A certain kind of onyx. was supposed to preserve the vigor and good estate of the whole body. One phssician went so
far ss to declare "that in the body of a swallow there is a far ss to declare "that in the body of a swallow there is a
stone found called chelidonius, which, if it be lapped in a fair cloth and tied to the right arm, will cure lun ties, madmen, and make them amiable and merry." Herbs were also in great request, and daisy tea was accounted a certain cure lor gout and rheumatism. Dr. Bulleyn (of the same family
as Quepln Aan Bulleyn,) a physician in the reign of Elizaas Quepn An Bulleyn, a physician in the reign of Eliza-
beth, prescribed for a child suffering under a certain nervous malady "a small young mouse roasted." The same doctor stated that "snayles broken from the shelles and sodden in whyte wyoe with oyle and sugar are $\mathrm{V} \in \mathrm{ry}$ holsome, because they be hoat and moist for the straightness of the lungs and cold cough.'
Fatal Experiment.-A few years ago, a young lady in easy circumstances eojoyed good health; she was very plump had a good a ppetite and a complexion bloming with roses
and lilies. She begau to look upou her plumpness with suspicion; for her mother was very fat, and she was afraid of becoming like her. Accordingly, she con-ulted a woman, who advised her to drink a small glass of vinegar daily: the young lady followed her advice, and her plumpness diminished. she was delighted with the success of the remedy and continued it for more than a montl. She began to liave
a cough, but it was dry at its commencement, and was cona cough, but it was dry at its commencement, and was con-
sidered as a slight cold which would go off. Meantime, from day to day, it became moist; a slow fever came on. and a difficulty of breathing; her body became lan, and wasted away; night sweats, swelling of the feet and of the legs succeeded, and a diarrhea terminated her life. on examination, all the lohes of the lungs were found filled with lubercles, aud somewhat resenbling a bunch of grapes.

Compostrors.-Compositors are a placid and unimpressionable race, who do their work datifully, without yielding to the intellectual influences represented by it. A clanse of an Act of Parliament, with all its whereases, and be it en-
acteds, and hereby repealeds, creates quite as much emotion in them as the most brilliant burst of the fashionable poet of the day. They will set you up a psalu or blasphemous ditty with the same equanimity, not retaining in their minds any clear distinction between them. Your writing must be
something very wonderful, indeed, before they distinguish it something very wonderful, indeed, before they distinguish it from other "copy," except by the goodness or badness of the
hand. A state paper, which all the world is mad to know about, is quite safe in a printing office; and they will set up what here is set down of them without noticing that it refers to themselves. It is said that this stoic indifference is a wonderful provision for the preservation of the purity of
literature, and that were compositors to think with the auliterature, and that were compositors to think with
thor under the "stick," they might make dire havoc.

Frenca glove-makers are said to derive a handsome rev: enue from the rats of the Paris sewers, the integuments of Which vermin are converted into the most filmy of white
gloves for use in London daawing rooms.

G. F. Deftren, formerly of Nevada: Apparatus for separaling Gold from Pyrites. This is one of the most useful inventions of the day. Mr. Deetken has successfully worked sulphurets for a number of years in Nevada county, professes to have obtained greater results than others engaged in the same occupation. Mr. D. has receutly established himself in this County, on the San Brano Road. near the Islais Creek, where he has erected chemical and metallurgical works.
Tight Boots.-For years there has been a great deal of fault found with the prevailing Paris fashions, b cause they necessitated the compression of ladjes' waists beyond the natural 1 mits; and we have been among the fault-finders, because that we believed that undue compression of any part of the human form is priductive of evil results. We begin in the beyinning with this matter, in the first place objectiug in toto to the old-fashioned style of babies' belly-
bands, and keep on with our objections whenever and wherebands, and keep on with our objections whenever and where-
ever undue compression or restraint upon body or limbs is used.
Tight waists are our greatest abomination, and tight boots come next. They are not quite so life-destroying as corsets, but they are just as fuolish; and be whose thoughts are kept down by corns, bunions, and carbuncles never can expect to succe $d$. The dandy who will endure the misery
of a tight boot for the sake of showing a small foot-and there are plenty of them-deserves no pity.

Bootmakers want reforming. There is no more than one in a hundred who kuows how to make a good fitting article, and they will not learn, because people are not so particular as they should be. We would be willing to wager, if it were in our way, that there is not a dozen pair of feet in New York that have not been forced out of their natural shape by the shoemakers. True, we are not so bad as the Chinese, but we are bad enough
The luman foot is a very complex affair; its bones, and tendons, the nerves, and muscles are wonderfully arranged, and were at first all put in the position where they could work together for the best advantage, and it is our duty to keep them as nearly so as possible; and to do this, every full grown man and woman should have a pair of lasts of their own, made exactly like their feet, and should wear no boots or shoes not made carefully on these lasts.-Hygienic Teacher.
How to Brfak a Bad Habit.-Uuderstand clearly the reasons, and all the reasons, why the habit is injurious.Study the snbject till there is no lingenng doubt in your mind. Avoid the places, the persons, the thoughts that lead to the temptation. Frequent the places, associate with the persons, indulge the thoughts, that lead apyay from the temptation. K Kep busy; idleness is the strength of bad habits. Do not give up the strugele when you have broken your resolution once, twice, ten times, a thousand times.That only shows how much need there is for you to strive.
When you have broken your resolution, just think the matWhen you have broken your resolution, just think the mat-
ter over, and endeavor to understand why it was you failed, so that you may be on your guard against a recurrence of the same circumstances. Do nit think it a little or an easy thing you have undertaken. It is folly to expect to break up a babit in a day, which may have beet gathering strength
for years. This, in brief, is our answer to a question which for years. This, in brief, is our answer to a question which
is put to us by anxious inquirers from ten to twenty times is put to us by anxious inquir
a-week.-Hyqienic Teacher.

A Rolling Stone Gathers so Moss.-Well! what of that! Who wants to be a mossy old stone, away in some damp corner of a pasture, where sunshine and fresh air never come, for the cows to rub themselves against, and for snails and bugs to crawl over, and for toads to squat under among poisonous weeds
It is far better to be a smooth and polished stone, rolling along in the brawling stream of human life, wearing off the rough corners, and bringing out the firm crystaline a ructure of the granite. or the delicate veins of the agate or the chalcedony.
It is this perpetnal chafing and rubbing in the whirling what use he is good for. The sandstone and soapstone are soon grourd down-to sand and mad, but the firm rock is selected for the towering fortress, and the diamond is cut and polished for the monarch's crown.
SEawerd is being pxtensively used by New York upholsters in place of curled hair. It is said to be a: very good substitute, and quite a brisk business has grown up on Long Island, in gathering and drying it for the market. It is put op in bales like hay.

## FREDERICK KESMODEL, <br> Cutler and Surgioal Instrument Maker 817 KEARNY STREET,

Botween Juckson and Washington streets, san francisco,
$\mathrm{R}^{\text {ECEIVED }}$ a diploma at the Fair of the Mechances' Institute, Soptember, R 1888, alss in saeramento in 1881 tor California made Cutlery. The utiantiva of those atticted will HERNLA, or Rupture, or tny oue in-
terested, is called to his suew method of fitling and adapting Trusses to the terested, is called to his uew method of fitting and adapting Trusses to the
difierent cases. It is a well bnown fact that there bas as yet been uo system of Gitting T'russes. There are many different styles which have proven good in many cases, but they are all uucertuin and cannot be $r$ lied on, and in severe cases are altogether uselcss. The following are some of the advantages I claim for these Trusses a aove any and all others: First-The Pad is formed on the parts to be compressed by taking a planter cast. Secund-
Haviug a correet model, it euables me to make the Pad of any desirable material, such as horn, ityory, etc. Third-The Pad is so adjusted to the
mate spring that no movement of the body will move or displace it. There a
many other advantages. Examine and judge for yourselves. ap3 tf

## Our Mint, its Rules, Charges and Operations.

In the columns of a contemporary we observe some exceedngly interesting statistics of mint matters for many years past, from which we glean the facts that the legal limit of wastage was $\$ 207,76699$ for the three years ending April, 1857, while the actual loss was $\$ 266,31286$, exceeding the limit some sisty thousand dollars. During the four years of Mr. Hempstead's Superintendency, the legal limit was $\$ 235,38639$; while the actual lost was only $\$ 4,52035$ being some $\$ 230,000$ less than the limit, and, in fact, a little under two per cent. of the amount allowed by law to be wasted. The wastage of the Philadelphia mint is twentytwo per cent., against two per cent., wasted by our branch mint. The total expenditures for three years under Messrs. Birdsall \& Lott, amounted to the large sum of \$1.019,275 39. Under Mr. Hempstead, the total expenditures for four years were but $\$ 1,150,64814$; while the difference between the last year of Judge Lott and the last year of Mr. Hemstead was upward of $\$ 100,000$ in favor of the latter. On retiring from the Superintendency, Mr. Hemstead left an unexpended balance of appropriation due the mint of upwards of $\$ 86,000$. This certainly is a capital showing for our mint, and speaks well for Mr. Hemspstead's Superin tendency. Under Mr. Stevens, the present Superintendent, we have no doubt everything wil work in an equally satis factory manner.
For parting silver from gold when gold
is below $300-1000$ ths. fine.
from $300-1000$ ths. to 750
 Deposits Silver Bullion-Purchases.

LEWIS COFFEY
SUGGESTIUNS ABOUT FOREIGN PATENTS.
American inventors should bear in mind that, as a general rule, any invention which is valuable to the patentee in this country, is worth equally as much in England and some nther foreign countries. Four patents-American Euglish, French and Belgian-will secure an inventor exclusive monoply to his discovery among one hundred millions of the most intelligent people in the world.
The facilities of business and steam communication are
sucn, that patents can be obtained abroad almost as easy as at home. T'be majority of a'l patents taken out by Americans in foreign countries are cbtained throngh the Mining and Scientific Press Patent Agenct. Havingestahlished agencies at all the priocipal European seats of Govern ment, we obtain patents in Great Britain, France, Belginm.
Prussia, Austria, Spain, etc., with promptness and dispatch.
Models are not required in any Enropean country, but the utmost care and experience is necessary in the preparation of the specifications and drawingse
When parties intend to
When parties iotend to tuk out foreign patents, engravings should not be published antil the foreign applications have been made.
Cadtion.-It bas become a somewhat common practice for gents located in Eogland to send out circulars soliciting the patronage of American inventors. We caution the latter against beeding such applications as they may otherwise fall into the hands of irresponsible parties, and thus be defrauded of their rights. It is much better for inventors to entrust
their cases to the care of a competent, reliable agent at home.

While it is true of Most Euronean comntries that the system of examination is not so rigid as that practiced in this country, yet it is vastly important that inventors should have their papers prepared only by the most competent solicitors; in order that they may stand the test of a searching legal ex amination; as it is a common practice when a patentee finds a purchaser for his invention, for the latter to cause such examination to be made before he will except the title.
It is also very unsafe to intrust a valuable invention to any other than a solicitor of known integrity and ability. Inventors sbould beware of speculators, whether in the guise of patent agents or patent brokers, as they, cannot ordinarily be trusted with valuable inventions.
A Circular containing further information, and a synopsis of the Patent Laws of various countries, will be furnished on
application to J. Silversmith, Goveroment - House, San application
Francisco.
Miners, Inventors, Agriculturalists, Capitalist and Mechavics, will find it to their advantage to subscribe for
the Mining and Scientific Press-being the only journal of that class published upon this continent. Issued every aturday at four dollars per annum.

Address, J. SILVERSMITH,

CORNS AND BUNIONS REMOVED.
DR. BYRON C. KENNEDY, practical Chiropodist, late of Philadelphia, would most respectfully inform the citizens of San Francisco that he has opened his office at No. 12 Montgomery street, opposite the Lick House, where he is prepared to remove all excresences, such as Corns, Bunions, Inverted Nails, Enlarged Joints, Swelled Insteps, Frosted Feet, Chilblains, Callosities, and all diseases of the Feet, without pain or inconvenience to the patient.
Dr. Kennedy also attends to Ganglion, or Scorbutic Ulcers, and all other diseases of the Skin. He may be consulted at his office, No. 12 Montgomery street, opposite the Lick House, from 9 to 12 A. м.., and 2 to 6 P. M. Having devoted six years of study to this important, bat too much neglected, braoch of human knowledge, and having studied anatomy under the most skiiful and scientific Professors of Philadelphia, and having made this branch of surgical science my specia ity for nime years, enables me to operate skilfully and successfully. In England, France and Austria the highest prizes are often awarded to practitioners in this branch of surgical science, and it occupies with others an equally lotty position in the profession.
Foiziu is an illustrous example, a shining light, among the philosophical stars of Europe, and Dr. Byron C. Kennedy has fully equaled him in this country, as a proof of which the Faculty of the University College of Philadelphia, Pa., complimented him with testimonials.
Dr. Kennedy has bent his earnest attention to the cure of these diseases, in which he has become so great an expert that he is now regarded as the leader in this country, in this branch of the profession, throughout the United States.
'Che following letter, which emphatically speaks for itself, was written by Dr. W. L. Stevens of the University Coilege of Philadelphia
 ynur departure for alifornin, and wishing to inform the citizens of Philia-
delphit and also the pennle of the State of California toe esteem in which delphi- and alen the penple of the state of Californis toe esteem in which
wo bold you, aud klowiog that nothng is more essential to our success
than the encour
 muclu neglected branch or hlumanul knowledge; that you have attained to the higbest rack in your profession, several of the Faculty and other prominent
citizens of Philadelphia hating sulmmitted to your manipulation, we can re-

 will repay yon for your years of sthiy, and that you may fin
or your exertio sin the gew and growing city of the Pacific.

## Regariling Patents.

We desire to call the attention of all those who intend applying for Patents, to our superior facilities for obtaining the same. Our arrangements are such that we can have all the papers prepared,transmitted and returned, with the Patent Right, in three months from the time the applicant places the matter into our hands; thus saving at least three months delay.

The expense to the applicant would be rather less, if the business be done by us, than if the papers, were sent to New York or Washington.
Thus by patronizing a home institution, our inventive aitizens can save both time and money.

We have prompt, intelligent and reliable agents in the city of Washingtun who attend punctually to all Patent Gusiness sent to them. We have agents, also, at London, Paris, Brussels, Hamburg, St. Petersburg, Berlip, Yienna, and other European capitals.

The Fatal, Conor.-The present war is teaching the nations many things both new and strange. Many of its lessons are great with present importance, as for instance the introducteon of irom armor for war vessels and the vastly increased weight and effectiveness of artillery now brought to bear, etc. There are other lessons which it is teaching, o misor present importance, but which to the observing mind are not to be passed over, as things of too trivial import to beheeded in this age of rapid progress. Among the lat ter lessons may be enumerated a large class of facts having a bearing upon the sanitary condition of soldiers in the field and hospital-to one of which, ouly, we would now allude, by copying from the N. Y. Journal of Commerce, the following paragraph which appears in that paper uuder the head.o "The Fatal Color."
In this age of Minie rifles, telescopic sights and sharpshooters, it will not do for our soldiers to wear red. Of all the colors that is the very best to "draw a bead" un. An aim which wight be uncertain at a preen, blue gray or neutral tint, becomes fearfully exact when it is brought to bear on a flaming red target. The fate of those two fine, daring reginents, the New York 5th and the Brooklyn 14th, of which red is the distinctive color, proves this. Fach of these regiments is reported to have lost far more than its proportion
of men in every engagement. About three fourths of the causalities among them are said to be in the red-troussered legs. After the battles of South Mountain and Antietaio the Brooklyn 14th, mustered less than fifty men. If the Zouaves could show a larger number, that is because they have been more recently recruited. the brave men of these two regiments would probably vote unanimously to retain he fatal uniform in which they have won their reputation But their safety, and that of all other regiments of the red order, denands that red trousers, red coats, red shirts, and red caps, should not be allowed on the field of battle.

Interesting Iron Experiment.-A eimple illustration serves to show a very important, fact connected with iron, viz : extreme elasticity, which yields to a force almost incredibly feeble.
Make a hoop of one inch square bar-iton. about the size of the brim of a man's hat; let the inside of the hoop be made quite smooth and true. On examiniag such a hoop, it would appear that the power even of a horse could in no way alter its shape or form, provided the strain be put to it fairly and equably. Now make a rod of iron of the thickness of a lead pencil, that shall exactly fit the diameter of the hoop, so that, when placed in the hoop it will not fall out unless the hoop be altered in shape. If, acting in a similar way, we take a child's wooden hoop with a stick across it in the centre, and then press it at the sides opposite to that of the cross stick, the hoop swill assume an oval shape, and, of cuurge, the cross stick will fall out. Just so does the yron hoop degcribid, act; when any one presses it, the iron rod falls ont, showing clearly the elasticity of the iron. The hoop will become oval shaped with a very little pressure not greater than that which can be exerted by a young girl.
A Whisting Oil Wrll-A novel incident, says the Philadelphia Ledger, occurred on the McClintock Farm Oil Creek, recently. That portion of the tubing of the Van Slyke well which runs into the receiving tanks from the well, was removed in order to make some repairs, learing the conductor pipe still in the well. Next moraing the inhabiants of tbat region were startled by tho sound of a gigan tic steam whistle, and found that it proceeded from this well. The gas forced up through the pipe had probably met with some obstruction, which caused it to perform in this way. The scream of this whistle was tremendous, and

The Great Theatre of Ephesus.-The great theatre of Ephesus has recently been examined and measured. It must have been the largest ever erected. Its diameter was 660 feet -40 feet more than the major axis of the Coliseum. Allowing 15 inches for each person. it would accommodate 56,700 spectators. Irury Lane Theatre (London) will contain only 3,200, and old Convent Garden held 2,800. Tbis edifice was the scene of one of Appolonius' miracles; it is memorable for the uproar described in Acts XIX., when the Ephesians accused Paul and the Christians in this building. To thie edifice the writer to the Corinthians alluded, probably, when he said: "If, after the manner of men, I have fought beasts at Ephesus, what advantageth me?"
Stability of Water.-We cannot any longer sustain the ancient faith in the stability of the "terra furma" as core tracted with the ever changing natnre of the sea. Recent discoveries have proved, on the contrary, that the land changee and the waters are stable. The ocean waintains always the same level ; but, as on the great continents, table lands rise prairies sink, so does the bottom of the sea rise and fall In the South Sea this takes place alternately, at sta:ed times. To such sinking portions of our earth belongs among others, New Holland. So far from being a young land, it ia on the contrary, with its strange flo a, 80 unlike that of the rest of the world, and its odd and marvelous animals, an aged dying island, which the ocean is slowly burying inch by inch.-Stray leaves from the book of Nature

Falling from Alort.-The New York Times, in an artiole on seamen falling from aloft, remarks :
We doubt if any one is aware of the number of seamen in our merchant service, whose lives are annually sacrificed in this way. It is a brief record and attracts no attention, which appears in the marine reports every morning-that on such a day, a seaman fell from the jib boom or the top-sail yard of the fine packet ship Blowhard, and was lost. Yet we venture to say that not less than a thousand seamen fall from aloft on A mer can ships every year, while in the discharge of their duty, and perish, unknelled, uncoffined, and uaknown.
Volcano near Rome.-A Roman journal states that something like an iucipient volcano has made its appearance near the Civita Techia railway, about two leagues from Rome, A committee of Engineers and Geologists have been sent to examine the eruptions of smoke and sulphurous-exhalations have been observed. In their report they state that the seat of fire is on the right hand of the railway, at a place called Monte delle Preche. For the space of two hundred square metres the ground is so hot that no one can stand on it long.

Conflagrations in the Pennsytitania Oil Regions.Numerous fierce and destructive conflagrations have from time to time occured among the oil wells of Pennsylvania the latest of which is thus noticed in a local paper dated, Oil City, Pa., Oct. 8th, I862.
A terrific fire is raging on Oil Creek, on the Blood \& Tarr farms. The oil wells and several refineries are in flames, and a large amount of oil has been consumed. The flames extend over half a mile. The loss is estmated at from $\$ 100,000$ to $\$ 200,000$. The flowing wells are still on fire. 30,000 bbls. of oil have been destroyed, besides a great many buildings.
Poisonous Green Paper.-Dangeious green paper hangings, stained with arsenical color may be recognized by a very sure and easy test, common spirits of hartshorn, or ammonia. On application of this, the beautiful but dangerous green becomes blue. The danger from these paper hangings is much greater than is commonly supposed. Deaihs are constantly being recorded, now that attention has been called to $\mathrm{it}^{2}$ which are clearly due to arsenical poisoning from its source.

## Lubricating Fluid.

Ferv subjects of an apparently simple nature are of more commercial importance than the discovery of some suitable and reliable material for the proper Jubrication of machinery and some self-acting machine or instrument which shall properly feed such portions of machinery, as from their condition, require a regular and constant supply of lubricating fluid.With regard to the fluid to be used, many preparations simple and compounded, patent and otherwise, have been offered to the public.
Mr. F. W. Perrott of Walworth, England, has recently patented, in that country, an invention which, after much experience, he thinks appears to meet the end desired a little nearer than any thing else yet produced. He uses a mineral preparation which cousists of micaceous iron ore, in combination by preference with oleaginous and fatty matters. Micaceous ore is a species of hematite, found in variou parts of the world. The propertions he uses are for one sort-ore 7 parts, oil and tallow combined, I part. The tallow is first boiled, and then the ore, which must have been carefully washed to free it from grit, is stirred in and mixed with the tallow, to which the oil is added. Another sort is composed of ore, $6 \frac{1}{4}$ parts ; tallow, $1 / 4$ part; oil, $1 / 2$ part : and a third kind-ore, 5 parts; tallow, $1 / 8$ part ; oil, $7 / 8$ part. The first is strong, the second medium, and the third a thinner and finer quality.
Mr. Leroy, of Paris, France, another eminent practical machinest, recommends a composition made up as follows: Tallow 252 parts; good lubricativg oil, 333 parts; soda, 14 parts ; potash, 12 parts ; and water, 389 parts. The potash is first dissolved in the water, the soda is then introduced, and, finally, the oil and tallow are kneeded with it.

Messrs. Huck \& Lambert, of this city, also make a very superior article of lubricating fluid, designed more particularly for heavy bearings-such as hevy teams, etc. It is produced by a chemical combination of suitable oily substance, purified by distillation, and carefully freed from all resinous, or pitchy matter which tends to gumming. The chief peculiarity of this article is its great consistencynot being attended by any ordinary exposure to the sun or any moderate artificial heat-its liquifying point being 200 degrees. Its tendency is to adhere closely to the axle and keep it cool, in a hot sun, where other materials would become heated and run or wear off.

The obstacles to good lubrication-hot bearings, the gumming of different oils, continual waste and its necessary lack of cleanliness, the constant attention required, great cost, and others which might be enumerated are all involved in the mode of lubrication generally employed. The gumming is as often occasioned by an excess of quantity, as by the impurity or inappropriateness of the material used. In order to obviate the excess of quantity and ensure a regular supply, an ingenious mechanic iu England has recently invented a simple instrument which may be attached to almost any machinery, and which is described in the London Mining Journal as follows:-

A simple tin box contains the lubricating matter, of which we have so many descriptions for all sorts of purposes. The box is furaished with an axle ruaning its whole length, supplied with as many cups as there may be journals or bearings to lubricate. At one end is fixed a small cog wheel, which is caused to rotate by a small crab-pin resting against an eccentric. The quantity contained by the cups as they rotate can be determined by a small screw inserted in each, and may vary from 1 drop to 50 , supplied to the lubricating tubes, and, once the box filled with oil, no further attention is necessary for from 12 to 24 hours.

The Editor of the Journal adds-
No waste can accrue, as all the oil necessary for lubrication being used up, and no more than is necessary supplied,
there is no further waste that must accrue by the use of the best known lubricators, after the lubricating' properties have been extracted and made use of. Seeing that by the simple nature of the construction of the instrument it will continue to work while the machinery is in motion, it will suffice to refill the cans every 12,24 , or 48 hours. according to the size of the instrument. It requires no unnecessary attention or constant labor. Any kind of oil may be used, an essential called Feint's oil has been for some months in use by the inventor. This instrument has not yet been brought into public notice, and it is only at the instigation of several friends that the inventor, Mr. Swan, has been induced to register his instrument, and allow the public the opportunity of profiting by his ingenuity. That the cause of the gumming of
various oils is difficult to solve, and depends, no doubt, on a peculiar quality in such oils, the exact composition of which is not yet determined, there can be no question; but that a rery great deal dejends on the manner in which oil is supplied to bearings, or journal-, requiring lubrication there can likewise be no question. We ourselves have seen hot bearings cooled by the incessant application of small quantities of resin oil, generally supposed to be peculiarly subject to the quality called gumming, and certainly not considered a good lubricator. But from what we haveseen at Messrs. Halg and Co.'s distillery, Hammersmith, and which every one in terested in this matter may also see, little more remains to perfect the present obstacless to lubrication.

Trial of a Steam Pump-A trial of Capt. C. H. Harrison's Ecceutric Pumps took place on Broadway wharf, in this city, on Friday last. The machine continued in operation for some hours, and its performance was witnessed by quite a number of scientific and curious spectators, all of whom pronounced it a complete success. A very much accelerated speed may be given to the pump over that applied at the late trial ; and, of course, the volume of water raised will be in proportion to the speed attained. It is a light pump, and the elevation to which a column of water can be raised is limited, only by the force of the driving power, and the strength of the pipes. This pump bas been arranged in three sizes; the first or smallest of which, at ordinary work, will raise seventy-five gallons per minute, the next larger size will raise five hundred in the same time, and the third or largest about three thousand gallons. Of course these amounts may be considerably increased, when occasion requires-provided the requisite power be applied. For mining purposes, where large quautities of water are to be raised from great depths, this pump seems to be peculiarly calculated, as it is simple in construction, compact, light, and easy of transportation.
From a return made to the Surveyor General of the State by the Assessor of the City and County of San Franciscn, we compile the following Statistics of the Vegetable and Fruit products of this County for the past Fiscal year:

| Apple | Trees, 4679, | Peach | Trees, 428, |
| :---: | :---: | :---: | :---: |
| Pear | 2771, | Plum | 196, |
| Nectarine | 32, | Cherry | 401, |
| Quince | 71, | Apricot | 50, |
| Gooseb'y | Bushes, 1701 , | Strawb'y | Vines, 2589, |
| Raspberry | 3390 , | Grape | 107, |

and the following numbers of Live Stock and Poultry during the same time :-

For a County that is nearly all brick and mortar this is a good showing.
Ochre.-It is almost impossible to keep pace with the new mineral developments of the Pacific Coast. The deposit of ochre, recently found at Marines, opposite Benecia, seems to be attracting some attention and may yet prove a valuable "find." The Cail, of recent date, says that a quantily of this mineral was lately placed in the hands of Mr. G. A. Lloyd, a master painter, of this city, who at once pronounced the article fully as good as the earth paint which is exported so largely from Sicily. Without trasting, however, to a superficial examination of that kind, he determined to thoroughly test the packages. The rock (for it is a species of soft rock) was ground up and Lloyd mixed it in the same manner that painters mix the terva de sienna. Slabs were procured and a very fine specimen of oak and rosewood graining was produced.
OPARR Rock- The float rock, in fact the original croppings taken from the famous Ophir mine, says the Virginia City Union, $22 d$ inst., are now being hauled away for crushing at the various mills. Mest of that large pile of rock, at first thrown out as worthless, has been crushed and found to pay, and now the croppings are to take their tura. The day is not far distant when much of the rock from other claims. now considered valueless, will be worked aud made to furnish its proportion of our daly shipments of bullion. The Ophir, we see, has commenced two new dump piles to receipe, we suppose, the first and second class ores, while the third class will probably contanue to be throwa upon the old and origi-
nal dump.

The California public is said to be a great patron of the arts and sciences, which in a measure we will rerify and attest as being the fact; but that it is pissessed of a proper judgment or knowledge of the real merit of an artist is far from the truth. We have been visited by many renowned in their profession abroad, and these have left our shores never to return. And ágain we have been favored with lesser talent, and because extensive posters puffs, and long-winded editorials, commendatory of such upstarts, heralded them, these have remained and amassed fortunes from a deluded people. Our public is decidedly a peculiar one, particularly for taste and style, for instance : a new nigger-minstrel is announced, and performs before the elite in this city; the next day the $A \not H a$ will come out with a criticism on his debut, as though he were as great as Formes, or any of the celebrated 'Tenors, and the miustrel goes on rejoicing night after night. A few who claim to be versed in music will go to see the opera, we will call these the elite of our city, and include therein the musical critics of the various daily journals, who like claqueurs, applaud before a melody or reci. tation is half finished, thus betraying a vast amount of stupidity and ignorance, besides annoying those sitting beside them. Opera after opera is announced and performed, and no matter how badly put upon the stage or executed, the same commendatory notices appear, and the "able management" (?) eulogized for the great enterprise displayed.
The opera of Macbeth has been twice performed, and we confess that since we listened to it in Havanna years ago by a Ialented Italian Troupe, the several leading artists failed not in ringing applause from the writer. Our pity and disgust reached its highest point, when, though informed by bills, etc., that new costumes, scenery, etc., hod been added for the occasion, those improvements failed to appear, while several scenes most essential to the work, were omitted, to say nothing of being seated in that dense little box of a melodeon, where the best efforts of arists, either vocal or instrumental, seem not to blend, but rather form a racket of musical and boisterous concord. That "able management"(?) ever ready to cater to the taste of our people, seems to be up with the requirements of a well appointed orchestra. One violin has to do all the tall "fiddling" iu that sublimest work of Verdi !-entitled Macbeth. The dollar paid we regreted, as did many others. We advise the Bianchi's, if they propose ta bring out more new operas, to take the Metropolitan, or some other theater, and appoint an orchestra worthy for the task ; the opera can then be successful. When the "able management" bandies for a tew paltry dollars with musicians by reducing their wages and similar shortcomings, no success can attend their efforts.
S.

Rice on Parer.-It appears from a recent report of a Committee of the Nevada. Territorial Legislature, that from the 29th day of November, 1861, to the 21st day of October, 1862-a period of less than eleven months-one hundred and eighty mining incorporations were formed nnder the general laws of the state of California to operate on mining interests within the territory of Nevada. The capital stock of these companies foots up to the round number of seventy-eight millions of dollars! We have not the means at hand of giving the amount of incorporated capital, organized in that Territory prior to the first above mentioned date, but presnme it cannot fall but little if any short of the amount since organized-which would give a total aggregate of at least $\$ 150,000,000$, a pretty good capital for a new Territory to begin business with.
Talc.-The editor of the Tervitorial Enterprise has seen some very fine specimens of talc obtained from an extensive deposit of this mineral somewhere in the vicinity of Pyramid Lake. This mineral is also found in great abundance near the Humbolt mines, where it is said that it may be obtained in aheets, four feet square! and in unlimited quantities. It has been suggested that this mineral might make an excellent and durable material for roofing. We can see no reason why it might not be altogether preferable to slate for such a purpose. The experiment is certainly worth a trial, and when we get a railroad from this city to the Eastern Slope, if the roofing experiment is found to succeed, it wonld afford a large amount of return business for the road, and furnish the city of San Francisco with a most elegant, and durable fire proof material for roofing and siding too.

## TO Minisg companies.

We earnestly solicit from mining companies and associations the following blank statement, filled according to the data hereby accompanying. The purpose for which we seek this information is iuportant to every citizen and stockhold er on this coast; it would also be prodnctive of beneficial results-i. e., inducing capitalists to invest in our mining operations, thereby infusing new life and vigor into business gene ally in our States and Territories. Little, if anything, is known of our metallic wealeh in Europe or the Eastern States, hence we desire as much of the blank filled by you as may be interesting and instructive to the people of this State and those interested abroad.

Wo know of no mining district in Europe or America where this kind of infurmation is not willingly rendered by parties uwning property of this nature; and we know of no better medium for making public the richness of our mines. Wir shall send blank; to mine and mill proprietors for every quarter, and will gladly publish the contente for the iuformation of the community:

| Titlo of tompany and butnee of omecers for the your. |  | Am't if stock \& value per share. | Whea Incorpornted |

Practical Science Indispensible to National Progrcss
＂Science and information are tbe joy and justification of mankind．They form the springs of a nation＇s wealth，be－ ing often，indeed，substitutes for those material riches which nature has，in many cases，distributed with so partial a haud．－Humboldl．
A more important trath was never penned by the great German philosopher than the one above quoted．It is a truth which should be converted into a living faith in the minds of all who have a leart interest in the material de－ velopment and national progress of the country of their birth，or of that land which they call＂home．＂It is one of the great faults of our politieal system that，with us，Gov－ ernment seems to lose all sight of its obligations to provide cheap and unirersal education after it has carried the child through a course of primary instruction iu our common schools．With the exception of a little stinted assistance， now and then，to some Colegiate Institution，where the dead and dying languages，and the mere theories of seience are taught to a linited extent，government，in this country， both state and national，seems to conclude that it has ful－ filled its educational duties to its adult population．There is not a leading state in Europe which is oot far in advance of this people in the practical acknowledgment of the im－ portance of providing intellectual training for those entrus－ ted with the great mercantile，mechanical and manufactur ing interests of their several nationalities．The evidence of this may be found in the large endo wments and appropria－ tions constantly being made by for eiga governments in sup－ port of institutions and publications connected with indus－ trial science．

There never was a period when a union of skill and sci－ ence was so much needed by the nations of the earth as at this present time－tbere never was a people to whose na－ tional advancement universal practical science would add such an impetus as to our own，and among our state or－ ganizations not one other of all the number would derive a tithe of the benefits which wou＇d accrue to Califoroia from a universal diffusion of such information as would combine science with its practical application to the development of the varied resources，mineral and agricultural，of our state． It is true and＂pity＇tis＇tis true＂＇that practical science has not yet reached its just position，in public esteem，with any people．It was a knowledge of this fact that brought out the happy expression already quoted from Humboldt，who again writes－＂An equal appreciation of all parts of knowl－ edge，is an especial requirement of the present epoch，in which the material wealth and increasing prosperity of na－ tions are in a great measure based on a more enlightened employment of uatural products and forces．＂
The time has been when a nation＇s prosperity was founded almost exclusively upon local advantages ir accidental com－ binations．In the incipient progress of England＇s greatness the occurrence of coal and iron within her burders，to an extent nowhere else known at the time，served as a founda－ tin for a progress in manufacturing art which，at one pe－ riod，promised to make and continue her as the overshad－ owing power of the earth．At that time immense tracts of fertile land，and a genial atmosphere pointed out this coun－ try as the future granary and staple producer of the world， while the still more genial climes of France and Italy seem－ ed to give those countries the exclusive coatrol of the pro－ duction of silks and wines．

Had not the struggles of science in the 16th century suc－
ceeded in freeing itself from the trammels of an ignorance that would have laughed Columbus out of the effort which gave to Europe a new world，and deprived Gallileo of his liberty for presuming to assert that the earth revolved on its axis，each of these countrirs，even to this day and a cen－ trey bence，might have continutd in the dull routine，which， according to the theory of the day，nature designed them．
But science，in its progress and practical adaptation to industrial pursuits，has of late produced a wonderful trans－ ition in haman conceptions，and is now teaching the bations the important lesson that they must acquire and maintain their respective levels by the force of their intellectual devel－ opments，instead of resting in security upon the natural de－ velopments of soil and climate．It has now come to the knowledge of mankind that that people which is most lib－ eral and earnest in the intellectua！development of its work－ ing and produc g g classes－of its artizans and mechanies－ is destined to override all local advantages and leave far in the rear，in material progress，all other peoples，who attach less importance to the intellectual development of their adult population．Even a superabundance of capital，or the possession of inexhaustible mines of the precious met－ als，if unaccompanied with intell ctual training，will be with－ out avail to save a people from becoming laggards in the modern march of national progress．
Neither the highest order of＂common sense＂nor the most abuudant gift of＂Yankee shrewdness＂will avail a people unless her＂sons of industry＂become the earnest disciples of practical science．Practice and scieuce must henceforth go hand in hand，or a general emigration of the former will soon leave the laggard people who reject the union in a slough of national despondency．
We have said enough，if，indeed，it were neccessary that angthing should be said to a waken our newly elect d legis－ lators，and all others having influence or power，to the im－ portance－to the indispensable necessity－that the people of our country at large and those of this state in＂particular should have the meaus placed before them for the acquire－ ment of practical，scientific iuformation－each one hav－ ing a reference to his own particular calling in life，whatever he may have chosen．The miner needs his＂Schonl of Mines ；＂the farmer his＂Agricultural College；＂the mer－ chant his＂Mercantile Academy；＂the mechanic and arti－ zau each need their appropriate fountain heads of in－ struction，and those who go down upon the sea in ships， who carry our manifold products to the ends of the earth， and defend our flag upon the highrway of wations，need also their＂Schools of Navigation．＂As surely as night follows day，so surely，unless our people demand and secure addi－ tional facilities for practical science to those which now ex－ ist，will our people fall，early，into the sere and yellow leaf of decay．Nothing else，as we have already said，can save us in the modern march of material progress wherein other na－ tious are endeavoring to outstrip ns by the superior intel lectual advantages，which they are placing within the reach of their peoples．The terrible dangers and awful forebod－ ings which now haug over our national existence，betoken less real danger to the Republic than does the apathy and indiference manifested by our people with regard to the sub－ ject which we have been considering，and which we propose to still further discuss in future numbers of the Press．

## THE GRASS VALLET（NEVADA CO．）SILVER MINES

During our recent trip to Grass Falley，we paid a visit to what are now pretty ext．nsively known，throughout the state， as the＂Grass Valley Silver Mines．＂We were accompan ied on the visit by our excellent friend Phil．Roberts，one of the proprietors，and one who is，if not the first discover－ er ，at least the chief pioneer of these mines，and one who has done as much or more than any other person toward their development．The mines are located about six miles， almost due East from the town，in a very wild，romantic re－ gion，and near the banks of Greenhorn Creek，from which stream the first company located took its name．

The mine is located，according to the best of our recol－ lection－for we did not notice particularly at the time of our visit－in a region of talcose slate．The direction is nearly N．W．and S．E．，dipping east，very winding，but ea－ sily traced，by surface croppings，about 3000 feet．The on－ ly companies which have yet struck the vein are the Green

Horn， 1200 feet，and thence，runuing south，the Central， 600 feet and the Monror， 1000 feet．The－next company， south，now kuown as the Potosi，but which，we understand， intends to chanye its name，have run a tunnel into the hill about 150 feet，but have not as yet struck the lead．
Below this company we understand that a company，known as the Buffalo Co．，have located a set of claims，and com－ menced work．We learn that they have already struck a beavy ledge，with good indications，which is thought to be a continuation of the Munroe Lead．
T＇he Monroe company is the only one which has been in－ corporated．They have ten or twelve men now at work，get－ ting our ore，under the direction of Mr．D．C．Odell，and are workiog fr m two shafts，and also running a tunnel，com－ mencing at the lower extremity of their ground．This tun－ nel will drain the upper portion of the mine fully 150 feet． This compauy was the first to secure a working prospect for the mine．One of the proprieters，Mr．（木．O．King，sent down some 1900 lbs ．of croppings，in July last，which were reduced by Bradshaw \＆Co．of this city，who returned a re－ sult of $\$ 42$ in gold and $\$ 53$ in silver．The rock crushed at their mill，hereafter mentioned，was taken from near the same locality．About 100 feet from their lower line a cross vein appears，which presents quite as favorable an aspect as the true vein，which latter does not appear to have been at all disturbed by this apparent intruder．The company has leased a mill which will be more fully alluded to at the close of this article，and when we were there had about 50 tons of rock on its platform．

On the Central company，nothing was doing so far as we were informed．A tunnel was driven up to the vein a short time since，from a neighboring ravine．We are not advised as to what their intentions are for the present season；but they will，in all probability，soon undertake active operatiuns， as their mine，ly．ng between two others known to be rich， must，beyond a doubr，be raluable．

The Green Horn company，which is made up chiefly of Grass Valley men，was the first locuted and has thus far proved the richest of the three，gold being its chief return． It is from this ground that all the gold specimens，which first brought this miue into special notice，were taken．Two pockets have been struck，the first in September，which yielded about $\$ 3000$ in specimens，the last in November， yielding about $\$ 400$ ．This mine is also well located for work ing．About 120 tons of rock have been taken out and a very comfortable board cabin built during the past two or three months，all at an expense of abont $\$ 350$ ．＂PuL＂how－ ever，has a pecaltar way of making a little money perform a large amount of work．The mine，when we were on the ground，was worked by an open catabout 40 feet in length on the line of the vein，which is very heavy，averaging，through－ out this cut about four feet in th ickne：s．Since that time a short tunnel has been co mmenced，from which rock will be taken during the wiater．When the Monroe company＇s tun－ nel shall have been driven up to the s uth line of the Green Horn claims it will drain their present workings to a depth of about 300 feet，and the upper portion of their grcund fully 600 feet．
Several other＂exteusions，＂than the ones named，have been staked off and recorded－among them we believe are the Green Horn，No．2，and the Chicago．Of course the excite－ ment connected with the successful opeaing of this mine has attracted to the neighborhood large numbers of prospect－ ers，by whom＂all the region round about＂will be thorough－ ly prospected，and perhaps other equally rich or richer leads will soon be developed．The neighborhood of these mines is an exceedingly rough one－very forbidding in appearance to the prospector，well wooded，and one which until the present time has been bat little examined．
the reducting mul and its machinery．
Subsequently to our trip to the mives we paid a visit to the Monroe Co．＇s mill，accompanied by one of its proprie－ tors，Mr．G．C．King．by whom we were introduced to Mr． S．F．Clouser，the gentlemanly superintendent．The mill is located in Boston Ravine，about balf a mile east of the main town of Grass Valley，and has long been well known there－ about as the Empire Mill．The mill has been leased for a short term with the privilege of purchasing on extrenely fa－ vorable terms．Of course the unexpectedly rich develop－ ment of the mine will determine the company to avail itself of its privilege to purchase．It is the intention also of the company to remove the mill，early in the spring，to the
mine, where a lucation has already teen erlect d, and where ed in copper mining, in order to lead to their early develan abundance of empluyment may be fund for the sume. opment. As we write we notice a paragraph in point in a This mill has eight heany stamps, to which four more will late issue of the Nevada Demoerut, which we condense as probatly be udted, and is driven by a vely superior 60 -hrirse power engine. The amalgumuting pans now in use are what are known as the " $K$ nox pans," heated by ateam chambers. The chemical process employed is that of Emilh \& Deweythe same which is used at the Ophir works in Washoe.
The first "clean up" was made on Soturilay of last week. after one week'a run, with a re ult, which greatly delighted and surprised every one interested in the euccess of this new enterprise. The Green Horn company had a little short of 20 tons of rock crushed, and took out two bricks ralued at over $\$ 4000$-upwards of $\$ 200$ per ton! and this rock, we know from careful inspection was from the most unpromising purtion of the pile lying at the vein! 'This clean up was mostly gold, there being merely a trace of silver. The result in that respect was what was expected. The rock which the company is now taking out. and which will enter into the next crushing, cuntains a large amount of silver with the gold.

We have not learned either the amount of rock cruehed or the mineral taken out from the Muvroe conpany's claims. The bricks from their "clean up" are silver bricks, containing, we believe, considerable gold, but their value cannat be as certained until the metal is parted. The result is, however, quite as satisfactory as that trom the Green Horn, and with many, more so, from the undoubted fact that that purtion of the mine is unquestionly silver ore, and hence more reliable than any gold mine. The Greeu Horu is locat ed about 300 feet higher than the preseut workings of the Monroe, and our impression is that when the former is worked to the same level with the latter, both will prove to be valuable silver miues, and fully establish the fact that we shall not hereafter be obliged to go to the Eastern Slope to find silver. We shall watch with considerable interest the future development of these mines.

## copper mining in california.

Copper mining has already become one of the features of California, and is evidently destived, at an early day, to employ a large amount of capital and form one of the clief mineral products of the State. From every direction we are in the constant receipt of inteligence of new discoveries and the successful workugg of already developed leads. The large pile of copper cre which has been lying upon the sidewalk in front of Duncan \& Co.'s, on Montgomery Strete for the past week or ten days, affords the most abundant evidence of the value of the recently opened mines in Calaveras county. The ore alluded to is from the Napoleon mine, situated sbout thirty miles east of Stockton, in Calaveras county. Quite a little town is growing up about this mine, which, in anticipation of its future importance has been clristened Napoleon City.
This company effected its first sale of ore a few days since, to an English House, which is represented in this city by Mr. William Shiels. The quantity sold was 100 tons, inclading, we presume, the lot now on Montgomery Street.This ore is bought oy assay, and will be shipped to Swansea, for reduction. The mines at Copperopolis, a few miles souther'y from Napoleon city, are already well known, and have for several months past, been raising and shipping large quantities of very good ore. The ore thus far raised in California is surposed, by persons well versed in copper mining, to be of a quality quite inferior to that which will be found at greater depths than have yet been reached in any of our copper mines.

## COPPER IN MARIPOSA.

Rich copper ore has also been recently discovered between Coulterville and the Merced river, in Mariposa county, which assays a very satifisactory percent of copper, besides a valuable percentage of silver and gold. A company, composed chiefly of Sacramento capitalists, with a capital of $\$ 300,000$, has already been organized to work the same. It is said that they will shortly have a hundred men at work upon the mine The existence of this vein of copper has been known for several years, but serious attention was never attrac'ed to it till since the late impostant copper developments in Calaveras county. There are no doubt many other known deposits of a similar character, in other parts of the State, which need only to be brought to the attention of parties properly vers-
follows!:-
copper mininu excitement in nevada col'nty.
It seems that the vein was discovered about a year and a half ago on a ranch near the Zinc House in that county.The owners had employed a man to sink a well on the ranch, who after going down a few feet, came upon a hard rock or mineral; he abandoned that place, and dug another we. at a distance of fifteel or twenty feet from the first. where he struck the edge of the same vein and threw out a considerable quantity of the mineral. A specimen of the ore was brought to Nevada and assayed, and found to be rich in gold. The proprietors of the ranch took the vein, and in connection with others, worked it as a gold mine, but from some reason it would not pay, and the enterprise was abandoned. One of the proprietore afterward removed to Amador county, and seeing some of the copper ore there, was struck with its resemblance to the ure in his supposed gold mine. He wrote to his partner still on the ranch to send him a specimen of the ore, which was assayed in Amador, when it was ascertained that it contained a large per centage of copper. The Amador partner immediately returned to Nevada county and re-located the lead as a copper mine. These facts, says the Democral, beconing known, numerous other parties repair ed to the locality, where hundreds are prospecting, and locatiag erery rock that looks as though it might contain copper. A number of veins have been found which evidently contain copper, and we shall soan know whether any of them are likely to prove of value.
the del norte county copper mines.
A party of scientific gentlemen rece ntly visited this copper locality for the purpose of giving the recently discovered mines in that region a thorough examination. They re urned on the last steamer from the North, fully impressed with a belief that the importance of the mines can scarcely be exagerated. Among the number (we quote from the Herald of this city) was Mr. Price, a Welsh geologist and mineralogist, who recen tly came out to this country with Mr. Sheil, a shipper of copper ore for the English market. He has for inany years been connected with the extensive smelting works at Swansea, and has therefore a practical knowledge of copper ore. He thoroughly examined the copper region and made more than one discovery of as great importance probably as any hitherto made. Mr. Price and his coropanions had every faci ity offered to them for investigation by the resideats, and his opinion will not fail to have great weight with persons who are interested in property in Del Norte county. Mr. Stearns and other geologists of eminent ability have also visited the county, and they coucur with Mr. Price in opinion.

The Panama brought 5,100 pounds of ore from the claim of the Excelsior Company, of which our fellow citizen, Mr. Fay, is President. Withio a year from this time, Del Norte will be classed among the mast valuable mineral regions of the world.

COPPER IN Plomas.
Some eight or ten months since a copper ledge was discovered by Messrs. Procter and Cooper, Genesee Valley, Plumas county. The ore, which is said to contain a large per cent. of copp er, is very heavy, and somewhat resembles coal. A company has been organized for working the mine, and in another season works will be erected upon the premises. About 16,000 pounds of the ore have been taken out, which will be sent to Boston for the purpose of being tes:ed.

The ship Regulator sailed from this port on the 21st ult, for Boston, with about $\$ 30,000$ worth of copper ore from the Copperopolis (Calaveras Co.) mines. Copper ore has now become a regular article of expoit from San Francisco. About half a million dollars, in value, from Calaveras Co. having already been sent forward. It is time that our Capitalists were casting about to devise some means for securing the business of extracting the metal from this ore within our own State. Present appearances indicate that the supply will soon be sufficient to warrant the necessary outlay of capital for the erection of works and conceutration of skill, which shall make California independent of the world in this particular.

## Mining Stock Report.

## San Fruxcisco, Dec. 5th, 1862.

There bas been more than usual animation manferted in the Miang stuck Market during the past week. The leading shares have gdvaneed beavily and luw priced stock has changed habds very freely.
Ophir continues to ste dilly advalice. Sanborn's Circular quotes one sato of 60 athares ( 5 feet) at $\$ 3,500$ per fout, 151 h Jnauary. Sales Have varied during the week from $\$ 2,500$ to $\$ 3,500$ per fuol-a wide margin for a well establisked, dis idebal payitig stock. Buyers are still basmg their operatiuns sumewhat on the expected divitends for last month. 477 bhares Changed hauds lant week.
Gould and Cury is stearily advaucing. Tho quotations for the week have rua frum $\$ 2,560$ lu $\$ 2,5: 6$ per foul- $\$ 2,700$ is generally asked. One sale of 20 shares is queted in the Circular ut $\$ 2,500$. It was sold at the Board for $\$ 2,525$. There are more purchasers thabsellers whe market.

than auy real protic which the company could hope to gain by transportag their ore so great a distauce for reduction.
Bald Eagle- 40 teet reported sulu on the 25 th ult. for $\$ 1$ per foot.
Onemtal-25 feet sold at $\$ 4$ per toot. A largo portiou of this Company's stock is reported to have chavged hauds recently al about this ligure. Ashland is enquired for ut $\$ 8-\$ 10$ is asked.
Ashluad is enquirud for ut $\$ 8$
Nevada is onqured for at $\$$ ?
The Euterprise's Stock Remarks of Nov. 22 says :-The Ironsides Complay (formerly Vermilliou Company) are reported to huve struct rich ruck it their tuvael. Several sutes have takeu place to-day in that stock at $\$ 5$ to Si per fuol.
Hudsell-last quotation, some ten days siuce, report 15 feet iu this compauy sold at $\$ 15$ per foot.
Bluomingdate at \$5.
Bluomingdale at 80 .
Codar Hinl Consolinated is enquired for, and could bo soll at very low fig Hes-Cedar Hill Tunnel was last offored at $\$ 6$,

## Cismeralda Stocks.

The Wıde West is still advanciog, and is quoted at from 8400 to $405 .-$ 3450 is generally asked. This stuct hus improved about $\$ 20$ durmg the Weuk.
Autelupe is quoted at $\$ 70$-with $\$ 85$ to $\$ 100$ asked.
Stua is quoted at $\ddagger 5$ and 88 is usked.
iver Hiil is $u 0$ quoted this week.
Utub has no buyers-herd at $\$ 40$.
Real Del Diuute quated at $\$ 12$ with $\$ 15$ asked.

## Coso Stocks.

The Josephine, Coso and Willow Springs are the best known Stocks in this district-but no receat trausactions have been made in either of them. The former is held at $\$ 20$. No offers are quoted for either of the others. The Josephine had bidders, the past week, at the Stook Bourd at from $\$ 15$ (0 $\$ 16$.-Hulders abking $\$ 20$ to $\$ 21$.
Coso-No biddere at the Beard-\$20 askəd.
Willow Springs-no bidders-\$4. asked.

## Mcxican Mines.

St. Nicholas Silver Mining Cu. is quoted by Sunboru's Circular at $\$ 100$. Miua Prieta fiodo no recent buyers, but is held at from $\$ 110$ to $\$ 130$.
Dios Padre is bold at $\$ 4550$.

## The Ophir Company.

At a meeting of the Stockholders of the Ophir Company held at their office, on the 26th ult. it was decided, conditionally, to purchase the interest of the Virgiaia Company in a vein located a short distance above the Ophir or Comstock rein. The amount agreed upon, we understand, is $\$ 100,000$-to be paid in monthly installments of $\$ 20,000$.

The Virginia Company, located a few feet above, it will be recollected, have recently set up a title adverse to the Ophir, the precise nature of which we have not learned. Whether this claim is considered of any account by the Ophir Company, we know not, but presume that that Company has been, in part, induced to make this amicable arrangement from the fact that whatever the decision might be, at present, another difficulty might arise in the future from the great probability, that as the two claims are dipping toward each other, they may eventually come logether: A very perplexing question would then arise as to who held the true vein-as it could not in that case belong to hoth. Un doubtedly the rein which should be found continnous in dip, would be considered, in law, the true vein. The danger to be apprehended is, that under such a decision the Ophir might be the loser. Hence the apparent propriety, of coming to an amicable and full decision in the matter at once, especially when it cau be done by the payment of the moderate sum named above.

## Washoe Items.

We condense the following items mostly from the Territotial Euterprise :-
Burning Moscow.-The Buraing Moscow, says the Territorial Enterprise, are making extensire preparations for working this mine in an ecolomical and systematic manner. A house has been erected some distance above the mouth of the tunnel in which their engine and hoisting machinery will be put up. Their engine, hoisting apparatus and a large pump are now on the ground. An incline his been commenced in the west end of the new building which will be driven down into the lowest portion of the mine as soou as the hoisting machinery is in readiness for use. 'They are now going to work in the right manner to work their claim to make a mine of it. A company may dig a tolerably deep aud very ugly looking hole, and may for a time keep the water out of it and raise some ore, with no other ma-
chinery than a bucket and windlass, but when mining is to be done science, system and machinery are demanded.

The Norton Company.-The Tirginia City Union says the Norton Company hare just struck their lead alter running a tunael twenty-ive feet into Cedar Hill, and sinking a shalt twenty-feet in depth from the end of the tunnel. Their lead is about four feet in thickness, and the quartz, of a hon-ey-combed rariety, is literally studded with pure gold. Very little, if any, silver has been fouud in it, as yet; but the amont of gold visible is large. Stock in this company has advanced the past week from $\$ 15$ to $\$ 30$ per foot.

Maldanado Lead.- The company working this lead, situated west of C street, betreen this place and Gold Hill, are taking out and heaping up ore which the Spaniards in charge say will pay for crushing. The ore is of a rusty, red appearance reembling, in many respects that of the Gold Hill miues. The Bachelor company, adjoining the
Maldanado on the south have completed the building comMaldanado on the south have completed the building com-
menced by them some tro weeks since, over their incline, and are now preparing to erect their hoisting machinery, etc.
Mount Davidson Tunnel Conpany Iaprotenents.-The Mount Davidson Tunnel Company are erecting a building at the mouth of their tunnel, just south of where the new Gould \& Curry ore house is to be erected. The building is intended as a work shop and tool house, also to shelter the mouth of the tunnel from the storms and drifting snows of winter.
Water.-In early times the great fear of those erecting mills on the various canons of this region, was that they Fall months for the numerous requirements of the works. Every year the volume of water fowing in the rarines has increased. Plenty is now ruaning throngh all the canons on which mills are located to meet every requirement, and we hear no more of the water bugbear.
Spanise No. 2.-This company have set up their engine and are very nearly ready to commence the woik of hoist ing the water from their shaft. They are about ready to commence with their steam hoisting and bailing apparatus
Phoenis Concentrating Company.-This company are Gold Hill. They bave some six or eight men at work at shoveling the ore into shaices, attendiag the concentrators,
assorting, ets. Soue seventy fire or a hundred tols of this assorting, ets. Sowe seventy five or a hundred this of this day, when we visited the works.

Genids Tried and Triumpeant.-This Play, recently from the pen of our ta'ented California author, Rev. Dr. H. Bien, of this cily, is to be produced on the 11thinstant, at the Anerican Theater. The plot, incidents, language and oovelty of this play will create a reputation for the author that will compare favorably with the most celebrated writers of modern drama. The beit available talent has been engaged for the season, and we trust oar readers and citizens will pay a just tribute to our Reverend friend who is in every way aeserving.
How to Test Surfer Ore.-Pound a small quantity of the rock supposed to contain the mettl, as fiue as possible, then place it on a shovel, or anything handy! and hold it over a slow fire, to burn away sulphur or arsenic, which are generally mized with the ores of silver. Then take a cup, or any glass or earthernware vessel, into which pour a small quantity of nitric acid (aqua for is,) in which put about a teaspoon full of the powdered ore, which boil in the acid for a minute or two. Then take some common salt, dissolved in water, in another ressel ; pour a small quantity of the salt and water into the acid; if it turns white and looks milky, there is silver in the ore. The above is a cheap, convenieut and certain test for silver.
We have given, in another column, a full description of the newly discovered Gress Valley Silver Mines, and the result of the first "clean up" from their mill. This, we believe, is the first silver mill which has been fitted up on the Western Slope, but, we trust, will be the precursor of hundreds. It has already pretty clearly demonstrated one highly satisfacto-
ry result-that silver ore can be found about Grass Valley, ry result-that silver ore can be found about Grass Valley,
in paying quautities. Having until recently been a resident of that town for some eight years, we know enough of the energy of her citizens to truat them for the future energetic prosecution of this new branch of mining, and feel the utmost assuance that no effort will be spared to make the
most out of this present development, as a stepping stone to future researches for more of the same kind of mineral.

## Important Publicaiton.

We have been favored, by the publisher, with the title page and prospectus of the quarto work entitled, "The Metalic and Agricultural Wealth of the Pacific States." The editor of this work has recently disposed of the "Mining and Scientific Press," with the view of devoting his antire atten-
tion to the publication of the work; to this end he is maktion to the publication of the work; to this end he is mak-
iug arrangements for an early visit to the Atlantic States and Europe. The work if carried out according to the prospectus, will be one of the most valuadle publications yet presented to the public, and will prove of incalculable bene-
fit to California and the Pacific Coast generally, in bringing fit to California and the Pacific Coast generally, in bringing
the immense mineral wealth of this region more promicently before the Capitalists of Europe. The object is a laudable one and ought to be encunraged. Mr. Silversmith is one of our oldest citizens and is well acquainted with the subjects of which he treats. He desires but little aid and that we trust he will readily obtain. The ftllowing is the prospectus:

RECENT PATENTS-Grauted to Caltfornia Inten
E. E. Matteson, Nevada: Hydraulic Derrick. This nvention has been illustrated in this journal, and has obtained great celebrity throughout the State.
Elander Heath, San Francisco, Spiral Spice and Sage Mill. See "Mining and Scientific Press," June 9th, $1^{\circ} 62$, Vol. $V$., No. XIII.
G. F. Deetien, formerly of Nevada: Apparalus for separating Gold from Pyrites. This is one of the most useful inventions of the day. Mr. Deetken has successfully worked sulphurets for a number of years in Nevada county, professes to have obtained greater results than others engaged in the same occupation, Mr. D. has recently established himself in this County, on the San Brubo Road. near the Islais Creek, where he has erected chemical and metallurgical works.

## THE EYES! THE EFES!! THE EYES!!! <br> DR. E. H. PARDEE,

Oculist and Aurist to the San Francisco Deaf, Dumb and Blind Asylum.

After a protracted blindness of more than five years. Dr. PARDFE has made himself thoroughly and scientifically acquainted with all diseases of the Eye, and is now practicing with a success that cannot be surpassed in the United States; and as proof of this he substantiates by many cases exhansted ifornia that have been cured by hin, after having New York city, Boston and Philadelphia.
From an extensive practical knowledge of more than 14 years, Dr. Pardee asserts, and is prepared to prove, that there has been more blindness from bad and improper treatment than from disease itself-how can it be otherwise when we take into consideration the effects of the old hacknied course of local treatment that patients undergo-Caustic to-day and Bluestone to-morrow-more painful than death, and always more terions than the disease. Patients are daily presenting themselves with chronic cases, and on inquiring what had been formerly done, the almost invariable reply is, "I had my eyes burned with canstic or bluestone;" "I was bled and blistered, then cupped two or three times a Wepk-had a blue pill prescribed for me at night, and salts
in the morning-was ordered in a dark room-to keep my in the morning-Was ordered in a dark room-to keep my
eyes tiohtly bandaged-to avoid the open air and exercise, with fifty other inconsistencies, the aggregate of which is sure blindness. Patients should be carefal and not place their eyes at the mercies of a man who does nothing but bure them daily, not investigating the circumstances of each particular case, but ignorantly and blindly adopting and fol-
lowiog theories the most erroneous, and destructive to the lowiog theories the most erroneous, and destructive to the
eye. How much more rational and consis'ent to consultan experienced Oculist, who thorougbly nnderstands every disease of this tender organ in all its aspects and varieties. Dr. PARDEE has from sixty to one hundred patierts under his daily supervision, and, with but very few cases, they have all
been treated by other physicians hefore applying to him-and all to no benefit. Those wio are doubtrul are permitted to call at Dr. Pardee's office and confer with the many patients who convene there between the hours of 9 and 12 in the forenoon. The Dr. has a large and only assortment of Artificial Eyes' on this caast, inserted, having all the movements of the real eje, and that theylon $k$ so life-like that no one can tell them, when properly inserted, frcm the real eye. These eyes are sold reasonable.
All the operations performed, such as "Strabismus," or ion or extraction;-"Plerygium," or fleshy membranes growing over the eyes. Artificial Pupils, \&c.

many other advantagea. Examine and judge for yourselves

FREDERTCK KESBIODEL,

Inventor and Patolitee.

Our Mint, its Rules, Charges and Operations.
In the columns of a contemporary we observe some exceedngly interesting statistics of mint matters for many years past, from which we glean the facts that the legal limit of wastage was $\$ 207,76699$ for the three years ending April, 1857 , while the actual loss was $\$ 266,31286$, exceeding the limit some sixty thousand dollars. During the four years of Mr. Hempstead's Superintendency, the legal limit was $\$ 235,38639$; while the actual lost was only $\$ 4,52035$ being some $\$ 230,000$ less than the limit, and, in fact, a little under twa per cent. of the amount allowed by law to be wasted. The wastage of the Philadelphia mint is twentytwo per cent., against two per cent., wasted by our branch mint. The total expenditures for three years under Messrs, Birdsall \& Lott, amounted to the large sum of $\$ 1.019,275$ 39. Under Mr. Hempstead, the total expnnditures for four years were but $\$ 1,150,64814$; while the difference between the last year of Judge Lott and the last vear of Mr. Hemstead was upward of $\$ 100,000$ in favor of the latter. On retiring from the Superintendency, Mr. Hemstead left an unexpended balance of appropriation due the mint of up wards of $\$ 86,000$. This certainly is a capital showing for our mint, and speaks well for Mr. Hemspstead's Superin tendency. Under Mr. Stevens, the present Superintendent, we have no doubt everything wil work in an equally satis黣ctory manner.

For parting silver from gold when gold

SUGGRSTION'S ABOUT FOREIGN PATENTS.
A merican inventors should bear in mind that, as a general rule, any inveution which is valuable to the patentee io this country, is worth equally as much in England and some other foreign countries. Four patents-Ameriran English, French and Belgian-will secure an inventor exclusive monoply to his discovery among one handred millions of the most intelligent people in the world.
The facilities of business and steam communication are suen, that patents can be obtained abroad almost as easy as at homs. The majority of a! patents taken out by Americans in foreign countries are cbtained tbrough the Mining and Scientific Press Patent Agrncy. Havingestablish-
ed agencies at all the principal Eurupean seats of Govern ed agencies at all the principal Enrupean seats of Govern
ment, we obtain patents in Great Britain. France, Belgium, Prussia, Anstria, Spain, ete., with promptness aud dispatch.
Models are unt required in any European country, but the utmost care and experience is necessary is the preparation of the epecifications and drawingse
When parties intend to tak ont foreign patents, engravings should not be publisbed until the foreign applications have been made.
Caution-It has become n somewbat common practice for agents located in England to send out circulars soliciting the patronage of American inventors. We caution the latter against heeding such applieations as they may orberwise fall into the hands of irresponsible parties, and thus be defranded their cases to the carc of a competent, reliable agent at their
While it is true of Most European countries that the system of examination is notso rigid as that practiced in this country, yet it is vastly important that inventors should have their papers prepared only by the most competent solicitors in order that they may stand the test of a searching legal ex amination; as it is a common practice when a patentee find a purchaser for bis invention, for the latter to cause such ex-
amination to be made before he will except the title. amination to be made before he will except the title.
It is also very unsafe to intrust a valuable invention to any tors should beware of speculators, whether in the gaise of patent agents or patent brokers, as they cannot ordinarily be rusted with valuable inventions.
A Circular containing furtber information, and a syoopsis of the Patent Laws of various countries, will be furnished on application to J. Silversmitb, Goveroment House, San Francisco.
Miners, Inventors, Agricultoralists, Capitalist and Mechanics, will find it to their adrantage to subscribe for the Minivg and Scientific Press-being the ouly journal of that class published upon this continent. Issued every Saturday at four dollars per annum.

Address, J. SILVERSMITH,

## CORNS AND BUNIONS REMOVED.

DR. BYRON C. KENNEDY, practical Curropodist, late of Philadelphia, would most respectfully inform the citizens of San Francisco that he has opened his office at No. 12 Montgomery street, opposite the Lick Honse, where he is prepared to remove all excresences, snch as Corns, Bunions, Iaverted Nails, Enlarged Joints, Swelled Insteps, Frosted Feet, Chilblaias, Callosities, and all diseases of the Feet, without pain or inconvenience to the patient.
Dr. Kennedy also attends to Ganglion, or Scorbutic UI, cers, and all other diseases of the Skin. He may be consulted at his office, No. 12 Montgomery street. opposite the Lick House, from 9 to 12 A . M.., and 2 to 6 P. M. Having devoted six years of study to this important, hat too much neglected. bruach of haman knowledge, and having studied anatomy under the nost skiiful and scientific Professors of Philadelphia, and having made this branch of surgical science my specia ity for nine years. enables me to operate skilfully and successfully. In England, France and Austria the highest prizes are often awarded to practitioners in this branch of sargical science, and it occupies with others an equally lotty position in the profession.
Voizin is an illustrions example, a shining light, among the philosophical stars of Europe, and Dr. Byron C. Kennedy has fully equaled him in this country, as a proof of which the Faculty of the University College of Philadelphia, Pa., complimented him with testimonials.
Dr. Kennedy has bent his earnest attention to the cure of these diseases, in which he has become so great an expert that he is now regarded as the leader in this conntry, in this branch of the profession, throughout the United States.

The following letter, which errophatically speaks for itself, was writted by Dr. W. L. Stevens of the University Coilege of Philadelphia
 your departure for Califorriza, and wishiug to inform the citizzons of thitla-
delphiz and also the penple of the Shite of California tue estem in which delphizand also the penple of the sthte of California toce esteem io which
we hold you, and kuowiug that nothing is more essential to your succesis we bold you, and knowiug that nothng is more essentint to your success
than the encouragoment which you may receeve fromin the people of Phila-
delphia, in the midst of which is the platground of your bor howi,

 will repay ymitior your years of study, and that you may find
or youre xertio siothe pew and gruviog city of the Pacific.
He subscrlve nurselves yours,

 remover a caucer frona nay malddemen, winger I had no use of for a pe
riod of six mouths. I cordially commend him to the sufering bumanity
Phuladelphia as a skifal oargeon.

effectually cured me of some torturing pests that I have been annoyed with for years
From the Rev. Walter Mr. Thompson : This is to certity that while sojouru-
in in Philadelphia, Dr. Kennedy has operated on three of my family to my ing in Philadelphia,
entire satisfaction.
From the Hon. Wm. M. Thorn, ex-member of the Ohio Legislature: This is
Frent great skill as a calued on or. Kennedy to operate on my fet: He displayed great skill as a curgeon, and I am satisaed that he has effectually
ol those torturing pests which havo annoged me for many years.
From Geo. F. Omerly, b37 Arch street: This is to certify that I called on
dr. Kennedy. He bes operated on may fect to my entire satifaction. au21

## Pracilcal Information for Bineral Proepectors.

Every working miner, and especially every "prospector" in Culifuroia, should have some knowledge whereby he may be enabled to arrive, at least, to an approximate idea of the nature and value of the various descriptions of ore which are constanlly coming under his observation. To neglect this suggestion is to ignore one of the most important advantages which even the commonest laborer, in this state, has of securing, at some opportune moment, a sudden and ample fortune. Very few persons, in this state, will read this article withont calling to mind some person, who, to their knowledge, has, for the lack of the very information contained in this article, setually lost an opportunity of enriching himself.

In our last issue wB gave a very simple, yet genorally re liable acid test by which the presence of silver in any ore may be readily ascertained. For the convenience of those who may wish to preserve the two, we have reproduced it at the conclusion of this article. We now proceed to give some general instructions by which almost any person may whe the common blow-pipe, with very satisfactory results, in all ordinary cases, such as will be likely to come under the notice of the Californis prospector. These instructions have been carefully prepared by a gentleman of large scientific attainmenta. In all ordinary cases, the rules here laid down may be implicitly depended on, but in complicated cages, where the assay gives uncertain results, proportionate eantion should be employed both in operating and deciding. In cases of an extremely doubtful nature, and for final conclusions, previous to the outlay of large expense, resort should always he bad to a practical and competent assayer

In our next issue we shall give a aimple method by which the amateur operator may ascertain, with a very great degree of exactness, the proportion of mineral contained in any given quantity of ore presented for assay.
"The miner will commonly judge a mineral to be metallic, If it hass metallic aspect, or if it feets particularly heary in the hand; but others sliso discover metallic propertiee to the blowpipe by:-

1. Fielding a bead of metal to the reducing flame, on charcoal, which is facilitated by the addition of soda.
2. Passing off in vapor, more or less dease.
3. Attracting the magnetic needle, after heating in the reducing flame on charcoal.
4. Coloring boraz strongly, either on charcoal or pipeclay.
tir hen a metalic bead is produced, it may ke pure sive him, lead, bismuth, copper, gold, or iron, copper, mickel, or co Gold and silver may be distinguished by not losing their brilliancy in the outer flame; tin by its whiteness and solt ress; lead and copper are immediately distinguished by their color ; and bismuth by fuming and evaporating in the reducing flame. The argenical alloys and compounds, not clearly distinguishable by these means, nor by their streak upon the black flint, must be examined by fluxing with borix. If it give green or pipe-clay, it is copper, though it
banpened to be bleached by the arsenic. If blue, it is banpened to be bleached by the arsenic. If blue, it is cobalt. If orange, yellow while hot, and the color fly on cool.
ing, it is irnn or nickel; and these are distinguished by their reducing flame on charcoal, where the borax head is bottle green with iron, brit almost colorless with nickel. If the metal yield no bead, but pass off in vapor, it is quieksilver,
arsenic, antimony, bismuth, or possibly tellurium, cadmium or zinc. If the vapor smell strongly of garlic, it is arsenic. If it leave a circular halo on the charcoal, it is antimony, tellurium, bismuth, or cadium. If the halo be white, it is an timony. If orange-yelow, it is to be subjected to the reducing flame If it disappear eavily, tibging the flame green, it is tel luriuro. If it evaporate with difficulty, and without tinging the llame, it is bismuth. If it be red or orange-red, it is cadium: If the mineral evaporate readily with no odor, or only that of sulphur, and without leaving a white or yellow ha lo, it probably contains quicksilver, which is proved, if on mixing a portion of it with soda and iron flings, heating it on charcoal, and holding a bit of gold coin in the vapor, the quicksilv or show itself on the coin. If using soda with the reducing flame, the assay bura after a while with a pale green flame and white smoke, covering the charccal with a white flaky powder, it contains zinc. If it will neither yield a bead of metal or volatilise, but attract the magnetic nee dle after the operation of the reducing flame, it most probably contains iron; but it may be nickel or cabalt-easily dis tinguished by fluxing with borax. If the mineral, or the residue, after part has evaporated, will neither yield a bead, volatise, nor attract the magnetic needle, we have then to flux it with borax, and the followiug table will skow what it contains:

## If it stains the borax,

| In the reducing flame, |
| :---: | :---: |
| on charcoal. | \(\begin{gathered}In the cacinating <br>

flame on pipe clay.\end{gathered}\)
The metal is

## Blue

Bright Green
Colorless or reddish.
Bottle Green

## Pale

Dirty green
Purple
Colorless

| Blue | Cobalt |
| :---: | :---: |
| Colorless | Chrome |
| Bluish Green | Copper. |
| Orange, while hot, paler as it cools. |  |
| As iron........ | Nickle. |
| Yellow. | Uranium. |
| Colorless. | Titanium... |
| Purple........... | Manganese |

"Copper is reduced in the metallic state in the reducing lame ; and hence, when in quantity, shows itself in its usual ed color in the bead.
"In mixtures of metals the indications are sometimes ready enoughi. If on pipe clay, we find the borax tinged between orange and purple while hot, and becoming purple in cooling, whilst it gives a bottle green on charcoal. we immediately perceive the indications of iron and manganese- a very common mixture. If, again, we find it bright green on
pipe clay, and emerald green on charcoal, a mixture of chrome and copper is indicated. But it more frequently happens that mixtures of metals give arobiguous results, and that they can only be ascertained by cautiou and perseverance.
"Although most of this is sufficiently easy, it requires a little practice; and, to give the operator confidence in his results, this is best performed upon substances which he knows to contain the metals he assays fur. Thus, if he operate on common mundic, he is certain, after a sufficient time of roasting and heating on charcoal, to obtain a residuum capable of affecting the magnetic upedle. White mundic will leave the same residue, after giving off an arsenical smoke.
Green copper (malachite) will be sure to yield o bead of copGreen copper (malachite) will be sure to yield' a bead of copper on charcoal, and will as certainly produce a five green with borax on pipe clay. Any of the ores of a lead may be promptly reduced to a metalic bead on charcoal.
"The vapor of antimony may be easily distinguished from that of arsenic, by the garlic odor of the latter. A minute particle of manganese will tinge borax a fine parple or pipe clay, in the outer flame: but on charcoal in the hlne flame. a much larger portion, dissolved ia borax, will become limpid and colorless. A partiole of titanium ore will give an oppo-
site result, bleaching on the pipe clay, and becoming purple on the charcoal.
"The experimenter should also not fail to reduce tin ore' by the aid of soda, and sume ore of zine by the same mieans; that he may become acquainted with the appearances iix these assays. Thus varying his practice as materials happen to fall ia his way, he will quickly acquire familiarity with the appearanees and resulta, and feel confidence in any afsay he may undertake.

How to Test Suver Ore.--Pound a small quantity of the rock supposed to contain the met $I$, as fine as possible, the place it on a shovel, or anything handy, and hold it over a slow fire, to burn away sulphar or arsenic, which are generally mixed with the ores of silver. Then take a cup, or any glass or eartheraware vessel, into which pour a small quantity of nitric acid (aqua fortis,) in which put about a tesspoon full of the powdered ore, which boil in the acid for a minute or two. Then take some common salt, dissolved in water, in another vessel ; pour a small quantity of the salt and water into the acid ; if it turns white and looks milky, there is silver in the ore. The above is a cheap, convenient and certain test for silver.

Tee Tallow Tree.-Among the trees which have of late been extensively distributed in the worthwestern provinces of India and Punjanb is the tallow tree of Ohini-stillingia sebifera. In China it is largely caltivated, and it is said that by its produce alone the taxes are paid in the district of Hong Kong. It grows equally well on low alluvial plains; ar the rich monld of canals in $^{2}$ sandy soils, and on the acs clivities of mountain. From its seeds fallow and oil are procured, which are extensively used in China. Its wood is hand and durable, and its leaves yield a black dye. It is now tbriving well in India. The tallow and oil are exsility procured from the seeds. The tree, therefore, is well worthy of attention.

Gigantio Iron Castrisgs.-Referring to the huge anvil block, weighing trom 35 to 38 fons, cast by Messris. Fawcett ${ }_{j}$ Prestor \& Co., Liverpool, for astean hammar, to melt which two air-furnaces and two cupolas were engaged; the quantity of iron meited being 40 tons- the time required to casit, from opening the furnaces, being less than a quarter of an hour, a correspondent of the "Journal of the Franklin Institute" says : "This was a heavy undertaking, and doubtless the large number of ladies and gentlemert who assemibled to witness the operation of casting were lighly gratified at the beantiful spectacle. In a mechanical point of view, however, the casting of a similay piece at the Port Richmond Ironworks, Messrs. I. P. Morris, Towne \& Co., on July 1, shows a much greater capacity for doing this description of heavy work. The block weighs 31 tome, and to pour it $37 / 1 / 2$ tons of metal were melted in one cupola in four hours from the time the blast was put on. The quantity of air used in the blast was 4,000 cubic feet per mimite. The coal consumed was 1 f . for each 9 fibs. of iron melted. The mould was filled in four and a half minutes pouring. The work was done with the ordinary resources of the establishment, and without any display or assemblage of visitors."

Gorng Up Hill.-The Enterprise sayd that people are going up hill in Virginia City-climbing up the sides of Mount Davidson and Mount Ophir to stake off and fence building lots: However high an individual may have set his stakes, another is always found ready to drive pegs a rod or two higher. Proceeding upon this plan what is to prevent people from going with household goods to the highest peak of Mount Davidson.

## Califorinia Manufacture of Turpentine and Rosin

A firm in Marjsrille have recently commenced the manufacture of the above articles. They have 8000 trees in the fooc hills, and are now engaged in tapping them. They cal culate on an average yield of about 300 gallons of turpentine and 60 of rosin per week, from the above number of trees upon which they propose to commence operating. The recent advance in the price of these articles will no doubt render their maunfacture in this State a very profitable business for some time to come, and as very little capital is required to go into the business we see no reason why large quantities may not be made in this State-sufficient not on ly for our own consumption, but also for exportation.

In the above cunnection we clip the following interesting article on the produce of turpentine, from the Oregon Far-mer:-
The immense forests in North Carolina. which cover the sandy ridges between the swamps and. Water-courses, consist mostly of the !ong-leaf d pine, Pinus palustr's of the Southern States. From them is gathered one of the great staples of North Carolina-the turpentine. And although this product and its derivatives are, in our country, almost in
as common use as bread and meat, very little is known of as common use as bread and meat, very little is known of
the manner of procuring them. We will therefore endeavor to describe it accurately: These trees at maturity are seventy or eighty feet high and their trunks eighteen or twenty feet in diameter near the base. They grow close tngether, very straight, and without branches to two-thirds of their
height. Overhead, their interlocking crowns form a continheight. Overhead, their interlocking crowns form a contin-
nous shady canopy; while beneath. the ground is covered with a thick, yelluw matting of pine-straw, clean. dry, level, and unbroken by uudergrowth. The privilege of tapping the trees is generally farmed out by the land owner, at a stated price per thousand, say from twenty to thirty dollars.
Under this privilege the laborer commences his operations. Under this privilege the laborer commences his operations.
During the winter he chops deep notches into the base of the tree, a few inches from the ground, and slanting inward. Above, to the height of two or three feet, the surface is scarified by chipping off the bark and outer wood. From this surface the resinous sap begins to flow about the middle of March, at first very slowly, but more rapidly during the heat of the summer, and slowly again as winter approaches. The liquid turpentine runs into the notches, or boxes, as they are technically called, each holding from of quart to half a gallon. This as it gathers, is dipped out with a wooden spoon, barrelled, and carried to market. where it commands the highest price. That which oozes out and har-
dens upon the scarified surface of the tree is scraped down dens upon the scarified surface of the tree is scraped down
with an iron instrument into a sort of hod, and is sold at an inferior price. Every year the process of scarifying is carried two or three feet higher up the runk, until it reaches the height of twelve or fifteen feet-as high as a man can conveniently reach with his long handled cutter. When chis ceases to yield, the same process is commenced on the
opposite side of the trunk. It is estimated that one man opposite side of the trunk.
will dip ten thousand boxes.
will dip ten thousand boxes.
The produce is carried to market on a sort of dray or cart which holds but two barrels, cousequently the barrels oreart ways seeu setting about in the woods in couples. The trees at length die under these repeated operations. They are
then felled, split into small sticks, and burned for tar. The then felled, split into small sticks, and burned for tar. The
dead trees are preferred for this parpose, because when life ceases, the resinous matter concentrates in the interior layers of the pood. In building a tar kiln; a small circular mound of earth is first raised, declining from the circumference to the center, where a cavity is formed, communicating by a conduit with a shallow ditch surrounding the mound.
Uिpon this foundation the split sticks are stacked to the Upon this foundation the split sticks are stacked to the
height of ten or twelve feet. The stack is then covered height of ten or twelve feet. The stack is then covered
with earth as in making charcoal, and the fire applied through an opening in the top. As this continues to burn with a smouldering heat, the wood is charred, and the tar flows into the cavity in the center, and thence by the conduit into the ditch, or into vessels sunk to receive it.

Iron Bripges. - The French will aequire quite a celebrity for iron bridges. The Orleans Company is now engaged in throwing one over the left bank of the Scorff, an arm of the
sea which forms with the Blavet the port of Lorient. The sea which forms with the Blavet the port of Lorient: The
bridge will have a length of 1,100 feet, and will be composed of ten arches in masonry, and three spans comprising altogether 576 feet. The metallic part will be supported by two piers, established on a rocky foundation, at a depth of
sixty feet below the ordinary tides. When this great work is sixty feet below the ordinary tides. When this great work is way (that is, as far as Lorient) will be in a position to be opened for trafic.-London Mining Mag.
The Suez Ship Cayal, which is being cut through the Isthmus, to connect the Mediterranean with the Red Sea will be 94 miles in length, 260 feet in width, and 26 feet deep. The work upon this gigatic enterprise is rapidly approaching a completion.

Californin's Gold-producing Rival.
The Colony of Victoria, in Australia, must always have a peculiar interest for Californians. It is a great rival in the production of gold-our chief rival in the commerce and industry of the Pacific-the head of the British Anglo-Sax on Colonies on the Pacific, as California is of the Anglo American States.
The first permanent settlement, in what is now Victoria, was made at Melbourne in 1835 ; but the population continued to be small until the gold discoveries in 1851, three years later than those of California.
'The Australian gold fields differ much in character from ours, being mostly in deep diggings, wher the hydraulic hose and sluice cannot be us d to advantag , or where at least
they are not emploged so extensively as in this state. They were very rich at first, and for a time theyturned out a strean of gold more abundant than that which flowed from
the claims of California. But the auriferous deposits of Victoria appear to be approaching exhaustion wore rapidly than ours. During the last five years, the decrease in produc tion has been rery rapid. By a comparison of the gold exports manifested during the first five months and a-lalf of the
present year, with the corresponding terms of the seven present year, with the corresponding terms of the seven
preceding years we see an arerage decrease of eight per cent annually. In 1855 ; the value Was $\$ 41,658,100$; in 1856 $\$ 29,484,005 ;$ in $1827, \$ 25,384,225$; in $1858, \$ 23,860,815$; $144,69 \overline{5}$; and in $1862, \$ 14,340,785$. The total decrease from 1858 to 1862 is about sixty per cent. If the manifrst ed exportation during the remainder of the present year be at the same rate as during the first five months and a halt the total exportation will be about $\$ 30,000,000$. Victoria imports more grain, provisions and manufactured articles generally than does Califoroia, but it produces wool, copper ore and several other articles of export in greater abundance; and the proportion of the amount of gold sent away and manifested to that produced may be about the same in the wo countries.
The amount of land cultirated is 430,000 acres, one balf the amount in this State. Two-fifths of the title land is in
wheat, one-fifth in oats, one-filth in hay and green forage and 1,400 acres in vines. The average wheat crop this year was 18 bushels per acre; of barley, 18 bushels; and of oats, 23 bushels ; of wine, 300 gallons.

The population of Victoria on the lst of March, 1862, was 544,046 , of whom 322,346 were males, and 221,700 females. The number of aborigines is less than 2,000 . Of the total number, 138,000 were born in Victoria, 169,000 in England, 87,000 in Ireland, 60,000 in Scotland, 24,000 in China, 19000 in other Australian colonies, 2.554 in the United States, 10,418 in Germany, and 1,250 in France.
The rate of wages is less than in California Journeymen carpenters, masons, bricklayers and blacksmiths, get from 8
to 11 shillings $(\$ 2$ to $\$ 3$ ) per day, and pick-and-shovel men
shillings. House servants are usualy hired for long terms. Female cooks receive from $£ 35$ to $£ 50(\$ 175$ to $\$ 250$ ) per year, geu
£16 to $£ 25$.

## Weather Prognostics.

Rules for foretelling the weather have prevailed for a long period. There are allusions to them in the scriplures, "I hen Aud in the morning, It will be foul weather to-day for the sky is red and lowering.". (Matt. xvi. 2, 3)-Some of the early poets give various weather signs. Virgil (Dryden's translation) says :-
"Net weather seldom hurts the most unwise,
So plain the signs, such prophets are the skies.
A Greek poet by the name of Aratas, is said to have written a poem of 417 lines, on weather proguostics, upward of two thousand years ago. From extracts translated into English which we have lately met with, it appears that some of the weather signs by which we are now guided, are mentioned in this ancient poem. For example:-
"Examine attentively when the sun rises and sets. Do you not see the perihelion shive north or south, or even at both of these points at the same time? Beware of seglecting this observation; for when this phenomenon shows itself, evening or morning, at the moment when the sun touches
the edges of the horizon, it is a sign that the great Jupiter is going to send us tempests."

The phenomenon alluded to is popularly called "sun-dog" in this country, and is generally thought to indicate stormy weather. According to Aratus-"It is also a sign of rain when a cluster of stars appear indistinct as one. When the heron flies swiftly to the coast, with great cries, it is a sign of coming tempests; and also when sea-ducks and other aquatic birds rise in the air. When the clouds extend them-
selves, rise, and cover the sky with a grayish veil; when we selves, rise, and cover the sky with a grayish veil; when we
see in the air a double rainbow; when the rays of any star see in the air a double rainbow; when the
lose their brilliancy, we may expect rain."
Of signs to be drawn from the animal creation he says : "Often when it is going to rain you will see aquatic birds dip, and dip again, incessantly; you will see the swallow flutter around the banks, balance itself upon the waves, and; skimming the water with a light wing, dare at last to bathe
in it its plumage. The importunate roice of the frog will be heard with more power from the midst of the marshes the melancholy cry of the solitary owl sturtle the moruing, Again, he writes; "The ravens and the jays foretell rain
when we hear them, in large bauds together, counterfenting When we hear them, in large bunds together, counterfetting
the voice of the sparrow-halk."
On the whole, probably there is hat little new under the On the whole, probably there is hut little new under the
un, in regard to foretelling the weather, since this poet wrote his prognostics, twenty centuries and a half ago.

## Declension of Matrimony.

The Newburyport Heroll says that the ceusus statistics show that over tour-sevenths of the marriages in Massachnsetts are among the foreign born population. Why is it? For the most simple of rea-ons--the foreign born can afford get married, and the native cannot; and th.s must be, so
long as our extravagant modes of life continue. In social life there never was a people tending to deèper and more destructive social corruption-and that is most evident from the records of all the courts, and the columns of all the newspapers-than Americans. Once was the time when a wife was a "helpmeet;" now in a thousand of cases you
can change the "meet" to "eat" and make it read more truthfully.

We boast of nur system of education; we have female high schools, female colleges, female medical schools and female heavens. Our gipls are refined, learned; and wise; they can sing, dauce, play pianos, paint, talk French and Italian, and all the soft languages, write poetry, and love like Venuses. They are ready to be courted at ten years, and can be taken from sclool and married at fifteen, and divorced at twenty. They make sp endid shows on bridal tours, can coguette and flirt at the watering places. and shine like angels at the winter parties. But Heaven be kind to the poor wre ch that marries in fashionable circles. What are they at washing floors? $O$, we forgot: nobody has bare floor ow-how vulgar that wow king bread and boiling beef? Why, how thoughtless we are

- to be sure they will board, or have servants. What are they at mending old clothes? But there we are again ; the fashion changes so often that nobody has old clothes but the rar men and paper makers now! What are they at washing babies' faces and pinning ap their trousers? And here is our intolerable stupidity once more; baving children is left to the Irish! What lady thinks of haviug children about her now? or if she is so unfortuvate, don't she put them to wet nurses to begiu with, and boarding schools af-
terward? We repeat-we have come to a point where young men hesitate and grow old be'ore they can manry and afterward keep clear of bankruptcy and crime. What is the consequence? There are more persius leading a single life-are there more leading a virtuous life? It is time for mothers to know that the extravagance they encourage is destructive of the virtne of their children ; that all the foolish expenditures making to rush their daughters to matrinony, are, instead of answering that end, teuding to destroy the institution altogether.

Effect of Music on the Sick.-The effect of music on the sick has been scarcely at all noticed. In fact, its expensiveness, as it is now, makes any general application of it out of the question. I will only remark here that wind instruments, including the human voice, and stringed instruments capable of continuous sound, have generally a beneficial effect.- While the piano-forte, with such instruments as have no contiuluty of sound, has just the reverse. The finest piano-forte playing will damage the sick, while an air "H"me, sweet Home," on the most ordidary grinding organ, will sensibly sooth them, and this quite independent of as sociation.-Florence Nightengale.

Rabity of tae air.-It appears that the extreme rarity of the atmosphere in Virginia City is quite noticable. This is to be seen in the reluctant manner in which the smoke of the city rises and hangs suspended but little above the roofs f the houses ; also, it is very plainly perceived by the amount f panting we are forced to do if we walk briskly a few hun. red yards.

Fire.-A fire broke out in Virginia City on Friday evenng of last week, on the west side of $\mathbf{B}$ street, a few doors south of Union, which would probably have been very destructive had it not have been almost instantly discovered and as promptly subdued. It took from the stove pipe of a

Horse Power.--The "horse power," as applied to steam engines, is said to have arisen when people began to supercede horse mills with steam mills. The manufacturer would naturally enquire of the party desiring a steam engine, how many hores he wished to dispense with-hence the term now generally used, which is certainly more practical than scientific.

## To mining companies。

We earnestly solicit from mining conpanies and associations the fullowing blank statement, filled according to the data hersoy accompanying. The purpose for which we seek this inforuation is important to every citizen and stockholder un this coust; it would also be productive of beneticial results-i. u., inducing capitalists to invest in our mining op rations, thersby infusina new life and vigor into businest gene ally in oar sitates and Territories. Little, if anything, is known of our matallic wealth in Farope or the Fastorn States, hence we desire as much of the blank filled by you as may be interusting and instructive to the people of this State und those interested ahroad.

We knus of mo mining district in Rarope or America where this kind of infurmation is not willingly rendered by parties owaing property of this nature; and we know of no better medium fur makiag pullic the richness of our mines. We shall spnd blanks to mine and mill proprietors for every quarter, and will gladly publish the contents for the information of the community:

HHE TAE KAW-LEGISLATIVE BLUNDERING.
By the telegraphic report to the Associated Press, pub lished in the Buletin of Saturday last, we are told under the head of Congressional proceedings, that "The Committee of Ways and Means will probably hold a meeting to-day [Dec. 5th] to consider certain propositions of amendments of the Tax Law, believed to be necessary for its successfal operation.

Here is a plain admission by the law makers themselves, that the Tax Law, passed at the last session of Congress, and which the Federal Tax Collectors are now endeavoring to enforce, is inoperative or unjust; probably both, in some of its provision. This is a fact that our mechanics, hereabouts, and business men generally, have seen from the time of the first promulgation of the law. It is to be regreted that so few mechanics and thoroughly educated business men are elected to Congress and our various State Legislatures. It is only by the election of, at least, a few such men, that the great Manufacturing. Mechanical and Mercantile interests of our country can be truly represented. Those interests will ever be imperfectly represented so long as mere politicians, and third rate lawyers-men with scarce a moity of busipess qualifications are elected to represent us in the halls of Legislation; The bill in question affords abundant evidence that it was prepared and passed by persons unacquainted with machinery, manufactures, and business generally. For example :-

Uuder date of October 9, Commissioner Boutwell writes to a gentleman in Baltimore:-"Your letter of the $2 d$ inst., containing inquiries as to whether the tax uader the excise law is laid both on castings and finished machinery, without reference to the fact as to whether the component parts of said machinery have been previously taxed as castings or not, is received.

I am of the opinion that the view talken by the manufac turer is sustained by the law. Castings are liable to a tax of three per cent, unless otherwise provided. When suld by the manufacturer the tax must be assessed and paid If afterward these eastings are assessed as component parts of other articles, the latter (that is the articles) pill be assessed without regard to the fact of previous pay ment."-New Yorlc Times, Oct. 16.

By this decision it will be observed that castings which are made at one thop and carried to another, belonging to a second party, and then put up into a complete piece of machinery are twice taxed, once at the shop where they are cast, and again at the shop where they are put together, as the component parts of an entire machine. Now this certainly cannot have been intended, or if so our law makers have been legislating for the beneft of large capitalists at the expense of smalier ones ; for instance :-

In the decision as given above by Gommissioner Boutwell, and the comments we have made thereupon, it will be observed, that large machine shops and manufactories, which are provided with foundries, pay a single tax upon their products that are composed partly of cast and partly of wrought metal while the small manufacturers of such articles pay a double tax on their castings. There are many small machine shope, the proprietors of which purchase their iron and brass castings from separate foundries, and fit up these castings, and combine them with other parts made of wrought iron and steel, Now the castings which they purchase are taxed three per cent, and their finished work is assessed at three per cent uponits whole value, of course their castings are taxed twice. On the other band, a large establishment is which machinery is manufactured, and
has a foundry connected therewith, escapes the tax upon their castings, \&c. Their castings are not taxed, as such, because not sold separately. This tax will inure entirely to the benefit of large machine establishments, and tend to the ruin of smaller ones.
This law also falls injuriously on other classes of manufacturers, and, in most cases is entirely, shifted, iu fact, from the capitalists, on whom it was intended to fall, to the poorer classes or the consumers; as for instance the tax on gas, in many cities has been directlly levied, by the companies, upon their customers, the consumers, who, in addition to their regular bill of so much to the number of feet of gas consumed, now find a little item of federal tex added to the usual amount. Now such a thing wrs never intended by the law makers-They have blundered again. We know not how the gas tax is paid in this city, but according to the New York "Gas Light Journal" that is the way some of the Eastern companies are paying their taxes, while others more patriotic, willingly submit to the true intent of the law and pay the tax themselves, as corporations. This plin of "shifting the responsibility" is very generally, (though oftentimes indirectly) practiced by manufacturers of all classes, to the detriment of the consuming and laboring people.

We judge from the item in the telegraphic dispatches of Saturday, alluded to in the outset of this article, that it is in part to obviate these evident abuses of the tax law, that the Committee of Ways and Means are about revising the same. We trust the Committee will have the good sense to consult some well informed practical men-merchants, mechanics and manufacturers-in their proposed modification thereof. It is not for the interest of the manufacturers that the burthen of taxation should fall upon the ponrer classes, neither do they, as a body, desire it. Their only wish is that they should be protected from the sharp practices of a portion of their own number, so that the burthen may fall equally upon those for whom it was intended-and upon those only.

## THE NEVADA INCORPORATION BILL.

We have said nothing heretofore upon the Incorporation Bill now pending before the Legislature of Nevada Territory, for the reason that having taken upon ourselves the management of the Press siuce that bill came up, and having many pressing dulues meapwhile crowding upon us, we have not had time te give it that attention necessary to a thorough knowledge of its provisions and probable workings-in fact we have been unable to find time to read the bill. We notice that there appears to be quite a contrariety of opinion regarding the bill among Washoeites themselves-the Territorial Enterprise being warmly interested in its favor while its contemporary. the Virginia Union, is decidedly opposed to its passage. We beli ve the bill is now pending between the House and Council. The following paragraph from an editorial on the propriety of the passage of the bill, which we clip from the latter paper, appears to us to be a correat view of the question:-
What should have been done in this connection was simply to pass a domestic incorporation law, leaving parties hereafter to incorporate under it, or under foreign law, as they might deem expedient. To close down so harshly and abruptly upon all corporations elsewhere formed, is not only unjust, but contrary to international courtesy and the prac. tice common amongst all enlightened commercial peoples. All we realy need at present is a law providing for domestic corporations, so that our citizens can organize at home or go elsewhere. as they may see fit. The question of foreign corporations should have been left for future legislation, when the light of exberience would have enabled us to adopt such measures as seemed necessary and just. A local law would have answered every purpose for the present, and sared us from the charge that will elsewise lie against us, of actiog in vilution of good faith and the comity of States. Of the same character is that clause demanding that the annaal election for trustees shall be held at some point within the Territory of Nevada.
The Volcanic Smelting Furnace.-The S. F. Call says snccessful experiments in reducing copper ore are now being made in this city with the Volcanic Smelting Furnace, a reecntinvention by Mre. E. J. Hall. Half a ton of the ore was vitrified and the metal running in less than an hour yesterday - the only fuel used being two bushels of charcoal to one bushel of rock. Specimen bars of copper from this furnace can be seen at the offices of Col. J. D. Stevenson and T. Ogg Shaw, in this city.

## COPPER.

The prospective value of the copper interest to this State and city can scarcely be overrated. 'l'he discoveries already made render it certain that millions of dollars must exe long be employed in working these mines, and large amounts of capital must also be invested in this city in the erection of machinery for rednction aud smelting; for no one can for a moment suppose that San Frane sco will long permit the transport from her wharves of the immense amount of copper ore which will soon seek a foreign market for its reduction, unless the necessary facilities are afforded at home. The copper mines of Calaveras, only forty miles from this (ity and within eight or ten of steam navigat on, are already assuming an importance or no ordinary magnitude. Over half a million dollars' worth of ore from these mines has already passed through this city for Eastern and European ports, and large amounts of foreign capital are now in this city seeking investment either in the mines themselves, as working capital, or ready for investment in the purchase of ore for foreign shipment. Our own capitalists are also buying and shipping for the Eastern market, to a limited extent, however. There is do class of mines which more readily commands capital than copper, nor any which dispenses more important local benefits to the community where they exist. They contribute far more real wealth than either silver or gold mines. We may safely predict that the copper mines of California will soon rival in importance the silver mines of Nevada, adding many millions, annually, to the real and personal wealth of our State. Many of the claims in Calaveras County are already held at a high valuation.

In our last issue we gave a general review of the extent and progress of the copper mining interest of the State. We shall continue to lay before our readers, from time to time, whatever news, of interest, transpires in relation to this growing hranch of industry. During the week we have noticed the following items:-
The Stockton Independent of Dec. 2nd, says in relation to the progress of Copperopolis:- "The Union Company at Copperopolis is now working with three engines, running night and day. The Keystone, Empire and Calaveras claims are giving out better prospects of late ; and the Webster, a new claim, under the management of Capt Sanders, is coming rapidly into importance. Schools, Sunday schools and religious societies are taking root at Copperopolis, and altogether the town is acquiring a degree of permanence and character bardly to be expected of a place whose foundations were laid but two years ago."

The Stockton Republican of the 4th instant, notices a rich copper strike as follows:-"During this week the men employed in prospectiug the Beauregard Company's cupper claim in Calaveras county, have struck some very rich rock, paying over $\$ 60$ per ton. The rock is in abundance, and the mine has every indication of becoming richer and more extensive as the shaft and prospect progresses. This is cheering news, as all the shares are held in this county and a large proportion in the city.

Meeting of Nevadans.-A large and respectable meeting of residents of Washoe, temporarily sojourning in San Francisco, was held at the Russ House, in this city, on the 8th inst, to take into consideration the proposed Incorporation Law, for Nevada Territory. After much and careful consideration the meeting adopted an address, or petition to the Territrial Legislature, setting forth, as the opinion of the meeting, that the law, as proposed would operate most disastrously to the interests of the Territury, and asking that the same may not be passed into a law.
It appears to be the general impression, both here and in Virgin'a Gity, among business men, that the passage of the law will have a tendency to restrain San Francisco capitalists from investing under it; and that capital now moving in that direction will be drawn toward the mines of Sonora. If the tide of mining trade toward Nevada should receive a chock by reason of the passage of such a faw as the one proposed, it will prove most disastrons to the now flattering prospect of that new Territory.

A Tunswe, after the manner of the Thames Tunnel is now in process of construction under the river Indus to serve as a road way for the great railroad now being corstructed between Calcatta and Peshawar.

## MINING AND SCIENTIFICPRESS

## WASHOE MINING INTHELIGENCE.

We conder se the folluwing items from the Washoe papers, chiefly from the Territurial Eute prise:-
It is thought hy many business men in Virgiaia City, that the nills now in operation there will be insufficient in number and capacity to crush all the ores that would be raised hero next season. The argument is that in the whole range from Cedar Hill to Gold Hill, a distance of nearly two miles, nearly every company halding ground are on their veins and will very soon be taking out pay rock, all of which must be reduced by somebody, and the mines already open are capable of supplyng what mills there are at present in the country. The Editor of the Einte prise thinks it. will be the wisest plan, however, for capitalists to defer the further erection of mills until the actual demand is seen. Next spring will be soon enough.

Large amounts of Gould \& Curry rock are still being erushed in the mills at Gold Hill and Silver City. The Central mill is also working upourock from that mive and turning out hesvy yields of silver.
The Mariposa mill has just cleaned up about four hundred pounds of amalgam. This ruass of metal is principally silver, the ore worked being from the Gould \& Curry mine.

Ophir Iaprovemants. - The Ophir Company have erected a very neat brick building just above the old Epanish stone house, intended for the Superintendent's room and offices for the Company. About fifty yards further north they have put up a stable, 32 by 72 feet. This latter is also a good building, well gravel dinside. These improvements are on the Company's claim.

Hoisting Housfs.-Along the line of the Comstock lead from Virginia City to Gald Hill, says the Enterprise, are a number of factory looking buildings which the stranger would be puzzled to comprehend. Smoke stackz protrude from their roofs; jets of steam spurt in intermittent puffs from their sides; but about them a stillness reigns that forbids the possibili'y of their being quartz mills. What then can be the work so silently performed by these laboring engipes ? Their work, weanswer, is not the noisy surface clatter of the reduction works; their labor is far below the surface of the earth in the dusky shafts that leadinto the dark bowels of the deep burried mine. There, day and night, they struin at hoisting up to duylight the gleaming ores of the black galleries below. These are looisting bouses.

A Few new buildings are still to be seen in process of erection in various parts of the city, but they are more scattered than a fortuight since.

Tur Ironsides.-The shaft of the Ironsides Company, on the Vermillion ledge, is down vinety feet. They are now drifting into the hill and taking out a good lookivg quality of white quartz, intermixed with a large proportion of the chlorine substance so abuadant in the Ophir. This company hope soon to be taking out first-class rock in sufficient quantities to ruv a mill or two. The company is located much higher up the mountain than the Comstock, so high, in fact, that it was thought at one time a thing almost incredible that paying ore should be found at such an elevation above the gieat zone containing the Virginia and Comstock leads.

The Pionefr Company after striking their ledge, have had to commence a drain-tunnel on account of water coming in too freely. This tunnel commeaces just below the Vermillion tunnel, Virginia ravine, will be 700 feet long, will strike the lead at least 300 feet below the surface, and about 150 belaw the first tunnel run. It is thought the new tunnel will not only drain the lead thoroughly bnt develop a better quality of ore.
United States Air Suaft.-The upper air shaft of the United States tunnel, on the ridge south of Cedar Hull, is now down nearly two hundred feet. It will be two hundred and forty feet at the point of its intersection with the tunnel. It is sunk in such a manner as to pass down about twelve feet south of the tunnel, and the two will be connected by means of a short drift. By sisking to one side of the tunnel and drifting into it all danger of rocks falling upon the workmen pas-ing along the tunnel is obviated. After the completion of the air shaft they are at present engaged upon, the company think they will be able to drift into the hill to their veins withont the expense of sinking other shafts for ventilation.

Iowa Shaft.-The shaft now being sunk on the Iowa, in
the northwest part of the city, has reached the depth of one hundred feet. The shaft is buarded up and divided into two compartments and the dirt is hoistod by means of a windlase with a double rope und two buckets. The company do not expect to strike their vein before the shaft ohall have attained a depth of one hundred und fifty feet- The rock now coming out is of a tolerably hard, blue quartzose species, containing iron pyrites io considerable quantities.
Pay Rock in Amfrican Flat.-The Enterprise is assured by an eye-witness that the Baltic Sweezy Company, south east of Gold Mi.t, and in the north margin of American Flat, have struck a fair quality of ore in their claim. They have a shaft down 160 feet in the lead, and are taking out rock resembling that of the Eliza Bradley on Sauta Rita claims - galena with sulphate of silver.
First Mila for Patmyta.- A lot of lumber went out to Palmyra district last week, to be used in the construction of a mill for the Yuba Company, or at least a mill for crushing the ore of the I uba lead. This is only the beginning-the first of many mills that will be erected in that district at no distant day.

Spanish No. 2.-Spanish Company No. 2 have erected a building over their engine and hoisting apparatus twenty by thirty feet in size. The builling was raised, nelosed and roofed between sumrise and sunset of the same day. In two days more the pumps and hoisting machinery were at work. Dava Mill.-The Dana mill is well nigh completed. It will be running in about a month. They have on hand a large stack of fuel, mostly nut pine, from the timber trees east of the Carson.
The Sierra Nevada Company have quite a lot of heavy timbers on the ground for use in their mine, and are receiving still more. Their timbers are brought from the foothills of the Sieria Nevada range.

The New Play, at the American, by Dr. Bein, has proved quite a success. The scene is laid in Italy. The business is good, and the interest of the piece well kept up throughout. The p'ay is pronounced by good judges, not only original. but very excellent, and one well worth seeing. It has been performed twice and will be again presented, this evening for the benefit of the author-which we trust will be a substantial one.

A new toll road between Virginia City and Gold Hill pierces a high hill through a tunnel 180 feet long.

## Mining Stock Report

SAN Francisco, Dec. 12th, 1662.
Ophir - Sanborn's Circuinar of last week quotes sales of 468 shares of Ophir
Stock at rates from $\$ 2400$ to $\$ 2750$ per toot. The sales ut the Boiard for the weok bave been very uniform-from $\$ 2450$ to $\$ 2455$, baving dropped somewhat from last week.
Gould \& Curry,-Fifly sbares were sold last week for $\$ 2550$ and 40 for $\$ 2560$, 1st Janurry. The sales the Dosid for the present week are quoted at from $\$ 2,475$ to $\$ 2,500$.
Contral. - 36 shares were sold $n t \$ 1,425$ and the same numbor subsequenty at $\$ 1,600$ as per Sauborn's Circular.
California, after remaining quiet for several weeks is quoted at $\$ 1,200$, an advance of $\$ 100.240$ sliares sold for $\$ 1,260$, 1 st of March.
Cholar is rapidy adivancing and is quoted at the Stock Board from $\$ 305$ to 350. $\$ 500$ was asked on Wednesday.
Potosi has been but litlle enquired

Potosi has been but little enquired for. Small transactions are quoted at from $\$ 75$ to $\$ 85$.
North Potosi is quoted at $\$ 7$-orfered at $\$ 750$.
Sierra Nevada is quoted at to 865 . 40 shares changed hands at that figre, last week.
Daney is quoted at $\$ 180$ bid 200 asked. A binght falling off.
Burning Mascow is quoted by Sauborn's Circular at from \$63 to \$65.
Mount Darideon is selling for $\$ 5$ 60- $\$ 6$ asked.
Meredith is not quoted. \$25 ja asked.
Burnside is not queted.
Towa quoted at $\$ 150$.
Norton is quoted at $\$ 20$. Forty shores changed hande at that price. Sacramento is quoted at $\$ 20-\$ 3250$ is abked.
Lucerne is not quoted.
Eale and Norcross is quoted at $\$ 250 \$ 300$ afked. No sale roported.

Lady Bryan-no sules quoted.

## Esmeralda Stocks.

The Wide West is ntill advanemg, and is quoted at from $\$ 400$ to 410 .$\$ 420$ ia generally asked.
Antelope is quoted at $\$ 70$-with $\$ 100$ asked. Sold at tho Board, on Thurs-

## ay for 100 dollars.

Etion is notquotod. \$8 is asked.
Silver Hiil ls quoted this week at from 12 to 14 dollaras.

Ltall has buycrant s18-held at $\$ 26$.
Roal Del Monto quoted al $\$ 20$ with $\$ 2.6$ asked. An advanco of $\$ 8$.

## Coso Stoclss.

The Josephlne haid bliders, thelpuast wrwk, at the Stock Bourd at from $\$ 15$ io \$16. - Heldora asking \$20 to \$22.
Coro- 12 to 13 at the Bmanil- $\$ 20$ nakad.
Whllow Spriges-queted al $\$ 15$.

## Mroxican Miner.

St. Nicholas Silver Mining Co. is quoted by sudborn'n Circular at $\$ 100$. caslina Prieas finda nu recent buyers, but la huld firm at 8120. 4 Dioo Padre le quoted at from 30 to 33 dollars.

## WASHOE STOCK REPORT.

## [Cornpiled ofliefly from the baiy Territorial Enterprise.]

Very little Stock is now beiog offered for sale io Virgluia City. Sevoral parties have recently withdruwn their ntucks from the market, preforing to Lurrow moncy at a high rute of interest rather than sell at preceot pricen, The low ratey now ruling present a mous faynrable nppor zunsty for profiable speculation, as money can scarcely be iuvested, nt this tume, in atocks which will not anon advaueu to a very high figure over that at which they are now belling. The conthuance of pleusant weutber causes the impreasion to pre vull that we are to have ou opeu wiuter, and oue highly favorable to min ing operations.
The La Crosse Company, it is reported, havo struck into the same rich ore as that how iu difputo between the Moscow and Madison Companies. Ajknowledgeof this will probably cause rome activity in that stock.
Norton sturk is, just uow, withuut demand. The satne development of rich ore which this Compmay has mate during the past fow weeks would, at a more favorable scason, have caused ready sale for their stock at three Limes its present rates.
Oriental. -Several amall transactions took place in thla stock, last week, at low rates.
Mammoth Ledge. Considerable ground in the Mammotir Ledge, Eagio District, is oficred for sale. Some two years since a great excitement was District, is offered for sale. Some two years aince a great excitement was
created in consequenec of the rich rock from this distruct. Tho entire diacreated in consequenec of the rich rock from this distrjet. Tho entire dis-
trict sppeared like obu continued mass of raluable ore, but after some lit-triet sppeared like obe continued mass of raluable ore, but after some lit--
the prosuecting, with ad unfayorable result the district was comparatively the prosuecting, with av unfavorable result the district was comparatively
deserted, it being impossible to find any well defiled ledge. It is athi thought by many that valuable discoveries must be made in that neighborhood.
Baltic was olfered, on the first instant, for $\$ 25$ per foot.
North American was enquired for, at same date, at \$5, but no trausacetions are quoted in either.
Sacramento.-Thirty dollirs was offered on the 1st. The rock of this Compaby's ledge is eaid to be very rich, though but ittle gold is to bn seen on the surface. The Enterprise of the Eth justunt notices a fine specimen from this ledge, on exhibition at the door of Paxton \& Thoraberg's Banking Houre, in Virgiuis City. The specimen weighs 600 Jbs.
Eome very rich roik has recently been struck at the toot of Cedar Hill, which has the appearal ce of veing a regular ledge. Several clams have been lecated on the Fiorth and South extensious of the Company making this discovery, who have taken steps for the prospecting of their claims, a work which will snon deciee whether tbe discovery in question is a ledge or merely i slide from the hill above. The discovery appears to be nttract ing considerable attention, and tbe discoverers are venturing the wildess ing considurable attention, and tbe discoverer
Ironsides.- The late activity in this stuck has aubsiôed. The demand for it bas censed, and the stnck bas been withdrawn.
The Tunnel stucks seem to be mectivg with much favor.
Mount Davidson und Cedar Hill are firm at San Francisco quotations. Sinme enquary is made for Unired States.
Wat erhouse-20 feet sold at $\$ 350$ per foot.
Gay-10 feet sold at $\$ 3$ per foot.
Union-is enquired for at $\$ 5$ per foot. This comn by havea iargeamount of rock upon the surface wlich has the appearainh of being rich, but still it is thought caunot be worked to a profit. The veln, however, 1 mproves with its depth, and the Company will no doubt boon develope a valuuble mine.
The Yellow Jacket is taking out valuable rock, which is puying a handsome prost-and, as a consequence, their stock is considerably enquired af ter, but at such rates as the holders persistently refuse to accept.
The Crown Point Miting and Mill Company appear to be doing a thriving business. Their mill is kept constantly at work upon rock from their mine. The Palmyra Dlggings,-Favorable accounts coutinue to be received from these Diggiugs. Several Comprnies are taking out ore, which is being these Diggitgr. Several Comprnies ares.
crushed with very satisfach. y resnlts.
crushed with very satiglach, y resnlts.
Nevada.-Six Dollars per fuot is offered for this atock; but none changes hands, holders firm at higher rates.
The Yolo Company which recently suspended operations on their tunnely have recommenced the work of extendiug the same to their several ledges. It is thought that ono bundred feet of extension will reach their first ledge. Belcher is enquired for at $\$ 10$ per fuot. This Company is located immodiately in front of the Crown Point ledge. Their stock is begining to attrant some attention amoug buyers.
Ten feet of Birdsall changed hands for $\$ 16$ per foot-a slight advance over last quotations. This mine has been opened at the surface, also at a depth last quotations. This mine has been opened at he surface, also at a depth
of 75 feet, and again at 100 feet. They bave proved that the vein is conof 75 feet, and again at 10 feet.
stantly improving with its descent, and hare now let a contract to open it stantly improving with its descent, and hare now let a contract to open it
bifty feet deeper still, from which point they propose to commence active Gfty feet deeper stil
mining operstions.
mining ouerstions.
Bloomingdale sold for $\$ 460$ per foot-ten feet changed bands.
Zouave is offered at $\$ 10$ per foot. This Company is now taking out fine ore, such as should grently ellhance the value of their stock. ore, such as should grenty emhanco the value of their stocks. ${ }^{\text {Y }}$. Ten dollars are offered for Eureka without finding buyers.

The following stocks, not enumerated above, aro in the market in Virginia City, aad held at the figures annexed :-

etc.

Botler Explosions.-Much is said in reference to boiler explosions about super heated steam, peculiar gaseous formations, and other conditions and cirenmstances, supposed to be entirely beyond ordinary control : yet the question has often been put and never yet answered in the affirmative"Did any person ever know of a boiler explosion when there was full evidence that every thing was right about the quantity of water in the boiler, about the safety valve, the braces and such other matters as may at all times be within the positive knowledge of the engineer?" All reliable experience goes to prove that neglect and carelessness are the producing causes of accident; and perhaps we may add that such carelessness generally arises from a lack of proper ap preciation of the responsibility of the position of an engineer, frequently on the part of the employer, who, unwilling to pay the wages of a competent person, too often takes up with one whose only knowledge of an engine has been obtained by working about one, at most, perhaps, occasionally assisting a competent engineer in the discharge of his duties. The control and manayement of a steam engine is one of the most important and responsible duties connected with machinery, and should never be entrusted to any other than one thoroughly educated to the business-one who is not only capable of running oce, but who also has sufficient knowledge to be able, at all times to pronounce upon the safety and capacity of an engine. None others should be allowed to run an engine, especially when lives are exposed to danger from any class of antidents. It is only by a refusal to employ incompetent person that a proper regard for the responsibil ity of the position can be maintained among engineers them-selves-such as will ensure a general immunity from this class of accidents.

A BIT of phosphorus, from a match, ignited under the finger nail of a German student at Dusseldorf and, though the flame was immediately extinguished, the hand swelled so rap idly that the whole arm had to be amputated.

A Piece of land was recontly sold in London at the rate - $\$ 9,300,000$ per acre, equal to $\$ 27250$ per square foot.

WORKS, Noxth Eea eneh; Office, 318 California st., SAN FRANCISCO

We have been favored, by the publisher, with the title page and prospectus of the quarto work entitled, "The Metalic and Agricultural Wealth of the Pacific States." The editor of this work has recently disposed of the "Mining and Scientific Press," with the view of devoting his entire attention to the publication of the work; to this end be is making arrangements for an early visit to the Atlantic States and Europe. The work if carried out according to the prospectus, will be one of the most valuadle publications yet presented to the public, and will prove of incalculable bene fit to Califirnia and the Pacific Coast generally, in bringing the immense miveral wealth of this region more prominently before the Capitalists of Europe. The object is a landable one and ought to be encomraged. Mr. Silversmith is one of our oldest citizens and is well acquainted with the subjects of which he treats. He desires but little aid and that we trust he will readily obtain. The following is the pros pectus:

## THE EYES! THE FYES!! THE EYES!!!

## DR. E. H. PARDEE,

Oculist and Aurist to the San. Francisco Deaf, Dumb
und Blind Asylum.
After a protracted blindness of more than five years. Dr. PARDF:E has made himself thoroughly and scientifically acquainted with all diseases of the Eye, and is now practicing with a success that cannot be surpassed in the United States; and as proof of this he substantiates by many cases now in California that have been cured by hin, after having exhausted the skill of the eminent physicians and oculists of New York city, Boston and Philadelphia.
From an extensive practical knowledge of more than 14 years, Dr. Pardee asserts, and is prepared to prove, that there has been more blinduess from bad and improper treatment thav from disease itself-how can it be otherwise when we take into consideration the effects of the old hacknied course of local treatment that patients undergo-Caustic to-day and Bluestone to-morrow-more painful than death, and always more tedious than the disease. Patients are daily presenting themselves with chronic cases, and on inquiring what had been formerly done, the almost invariable reply is, "I had my eyes burned with caustic or bluestone;"
I was bled and blistered, then cupped two of three times a
reek-had a blue pill prescribed for me at night, and salts in the morning-was ordered in a dark room-to keep my eyes tightly bandaged-to avoid the open air and exercise," with fifty other inconsistencies, the aggregate of which is sure blindness. Patients should be careful and not place their eyes at the mercies of a man who does nothing but barb them daily, not investigating the circumstances of each particular case, but ignorantly and blindly adopting and following theories the most erroneous, and destractive to the eye. How much more rational and consis' ent to consult an experienced Oculist, who thoroughly understands every disease of this tender organ in all its aspects and varieties. Dr. PARDEE has from sixty to one hundred patients under his daily supervision, and, with but very few cases, they have all bee" treated by other physicians hefore applying to him-and all to no benefit. Those w, o are donbtful are permitted to call at Dr. Pardee's office and confer with the many patients who convene there between the honrs of 9 and 12 in the
forenoon. The Dr. has a large and only assortment of Artiforenoon. The Dr. has a large and only assortment of Arti-
ficial Eyes on this coast, inserted, having all the movements of the real eye, and that they lork so Tife-like that no one can tell them, when properly inserted, frcm the real eye. These eyes are sold reasonable:

All the operations performed, such as "Strabismus," or cross-eyes-"Cataracts"-or removal of the Lens by absorption or extraction;-" Plerygium," or fleshy membranes growing over the eyes. Artificial Pupils, \&c.

Having a correct mudel, it eurbles me to mike tho Pad of any desirable material, such us horu, wory, ete. Third-The Pad is so adjusted to the
spring that no movement of the body will more or displace it. There are spring lhat no movement of the body will more or displace it.
many other advantages. Examine and judge for yourselves.
FREDERICK KESMODEL,

## Our Mint, its Rules, Charges and Operations.

In the columns of a contemporary we observe some exceedngly interesting statistics of mint matters for many years past, from which we glean the facts that the legal limit of wastage was $\$ 207,76699$ for the three years ending A pril, 1857, while the actual losi was $\$ 266,31286$, exceeding the limit some sixty thousand dollars. During the four years of Mr. Hempstead's Superintendency, the legal limit Was $\$ 235,38639$; while the actual lost was only $\$ 4,52035$ being some $\$ 230,000$ less than the limit, and, in tact, a little under two per cent. of the amount allowed by law to be wasted. The wastage of the Philadelphia mint is twenty-
two per cent., against two per cent., wasted by our branch two per cent., against two per cent., wasted by our branch
mint. The total expenditures for three years under Messrs. mint. The total expenditures for three years under Messrs.
Birdsall \& Lott, amounted to the large sum of $\$ 1.019,275$ 39. Under Mr. Hempstead, the total expenditures lor four years were but $\$ 1,150,64814$; while the difference bet ween the last jear of Judge Lott and the last, year of Mr. Hemstead was upward of $\$ 100.000$ in favor of the latter. On retiring from the Superintendency, Mr. Hemstead left an unexpended balance of appropriation due the mint of up wards of $\$ 86,000$. This certainly is a capital showing for our nint, and speaks well for Mr. Hemspstead's Superin tendency. Under Mr. Stevens, the present Superintendent, we have no doubt everything wil work in as equally satis factory manner.

In regard to the deposits of Washoe silver, the rule will hereafter be, that the value of gold contrined in the same will be paid in gold coin, and the value of filver in silver coin. The value of the silver will be calculated at $\$ 1.21$ per standard oz, and is exempted from the coinage charge, unless deposited for silver dollars, is which case a charge of $1 / 2$ per cent. will be made additional. Bullion of the above denomination will be entered on the gold and silver register, as most congruous with the physical aspects of the material, but in the warrant it must be marked that so much is to be paid in gold and so much in silver, according to the con tents reported by the assayer. The above rules, and charges
were promulgated on July 10th, by Superintendent Robert were promul
J. Stevens.
U. S. Branch Mint, Nov. 6th, 1861.

On and ufter the 15 th inst., a charge varying in accord ance and the character of the deposit, from half a cent to three cents per oz., gross, in addition to the general rates, and be imposed on all bullinu deposited for coindge or manufacture, which will require toughening or extra refining to render it suitable for mint purposes.

Robt. J. Stevens, Superintendent.

## Regarding Patents.

We desire to call the attention of all those who intend applying for Patents, to our superior facilities for obtaining the same. Our arrangements đre such that we can have all the papers.prepared,transmitted and returned, with the Patent Right, in three months from the time the applicant places the matter into our hands; thus saving at least three months delay.
The expense to the applicant would be rather less, if the business be done by us. than if the papers were sent to New York or Washington.
Thus by patronizing a home institution, our inventive citizens can save both time and money.
We have prompt, intelligent and reliahle agents in the city of Washangton who attend punctually to all Patsent
brisiness sent to them. We have agents. also, at London, business sent to them. We have arents, also, at Lnndon,
Paris, Brussels, Hamburg, St. Petersburg, Berlid, Vienna, and other European capitals.

Pacific Patent Agency.

## SUGGRE'TIUN'S ABOUT FOREIGN PATENTS.

American inventors should bear in mind that, as a genersl rule, any invention which is valuable to the patentee io this country, is worth equally as much in Encland and some other foreign countries. Four patents-American, English,French and Belgian-will secure an inventor exclusive monoply to his discovery among one hundred millions of the most intelligent people in the world.
The facilities of business and steam communication are such, that patents can be obtained abroad almost as easy as at home. The majority of a!l patents taken out by Americans in foreign countries are obtained through the Mining and Scientific Press Patent Agency. Having establish-
ed agencies at all the principal Earopean seats of Government, we obtain patents in Great Britain, France, Belgiom. Prussia, Austria, Spain, etc., with promptness and dieModels are not required in any European country, but the utmost care and experience is necessary in the preparation of the specifications and drawingse
When parties intend to tak out foreign patents, engravings should not be published antil the foreign applications have been made.
Caution.- It has become a somewhat common practice for agents located in England to send out circulars soliciting the patronage of American inventors. We caution the latter
against heeding such applications as they may otherwise fall into the hands of irresponsible parties, and thus be defrauded of their rights. It is much better for inventors to entrost their cases to the care of a competent, reliable agent $a^{a}$ home.

While it is true of Most European conntries that the rystem of examination is not so rigid as that practiced in this country, yet it is vastly important that inventors should have their papers prepared only by the most competent solicitors in order that they may stand the test of a searching legal ex, amination; as it is a common practice when a patentee finds a purchaser for his invention, for the latter to caupe such ex amination to be made before he will except the title.
It is also very unsafe to intrust a valuable invention to any other than a solicitor of known integrity and ability. Inventors should beware of speculators, whether in the guise of patent agents or patent brokers, as they cannot ordinarily be trusted with valuable inventions.

A Circular containing further information, and a synopsis of the Patent Laws of various countries, will be furnished on application to J. Silversmith, Government House, San
Miners, Inventors, Agriculturalists, Oapitalist and Mechanics, will find it to their advantage to subscribe for the Mining and Scientific Press-being the only jouroal of that elass published upon this continent. Issued every
Saturday at four dollars per annum Saturday at four dollars per annum.

Address, ... J. SILVERSMITH,

## CORNS AND BUNIONS REMOVED.

DR. BYRON C. KENNEDY, practical Chiropodist, ate of Philadelphia, would most respectfully inform the citizens of San Francisco that he has opened his office at No. 12 Montgomery street, opposite the Lick House, where he is prepared to remove all excresences, such as Corns, Buuions, Inverted Nails, Enlarged Joints, Swelled Insteps, Frosted Inverted Nails, Enlarged Joints, Swelled Insteps, Frosted
Feet, Chilblains, Callosities, and all diseases of the Feet, without pain or inconvenience to the patient.
Dr. Kennedy also attends to Ganglion, or Scorbutic U1cers, and all other diseases of the Skin. He may be consulted at his office, No. 12 Montgomery street. opposite the Lick House, from 9 to $12 \mathrm{~A} . \mathrm{m} .$, and 2 to 6 f . m. Having devoted six years of study to this important, hut too much neglected. branch of human knowledge, and having studied anatomy under the most skiititul and scientific Professors of Philadelphia, and having made this branich of surgical science my speciality for nine years, enables me to operate skilfully and successfully. In England, France and Austria the highest prizes are often awarded to practitioners in this branch of surgical science, and it occupies with others an equally lofty position in the profession.

Voizin is an illustrious example, a shining light, among the philosophical stars of Earope, and Dr. Byron C. Kenne dy has fully equaled him in this country, as a proof of which the Faculty of the University College of Philadelphia, Pa., complimented him with testimonials.
Dr. Kennedy has bent his earnest attention to the cure of these diseases, in which he has become so great an expert that be is now regarded as the leader in this country, in this branch of the profession, throughout the United States.
The following letter, which emphatically speaks tor itself, was written by Dr. W. L. Stevens of the University College of Philadelphia
Dr. Brzow C. Kprnany: Dear Sir-Learning that you are golng to Lake your departure for California, and wishing to inform the citizous of Philo-
dolphia and also the penple of the Stite of California the esteem in which dolphija and also the penple of the State of California the esteem in which
wo hold you, and knowing that nothng is more essential to your success we hold you, and knowing that nothng is more essential to your success
than the encouragement which you may recenve from the pemple of Philac than the encouragement which you may recevve from the penple of Philac-
delphia, in the midst of which is the playground of your boyhood, and
knowing that you have devoted years of siudy to this important hut too much neglected branch of human kuowledge; that you havertant but to the highest rank in your profession, several of the Faculty and other prominent citizens of Pliladelphia having submitted to your manipulation, wo can remost skilful surgeons of the agc, anrl we hope your success may be such an will repay you for your years of study, and that you may fad a broad feld or your esertio sin the gew and growing city of the Pacific.

A JOURNAL OF MININむ, AGRICULTURE, MANUFAGTURES, SCIENCE, ART, CGFMISTRY, INVENTIONS, ETC.

## Practical Information for Working Miners.

In our last issue, we gave, under the above head, certain rules by which working miners, and amateur prospectors, might, with the blowpipe, determine the churacter of the minerals upon which they were operating. We had intended to have prefaced those rules with a few practical hints in regand to the use of the blowpipe, but neglected to do 80 until it was too late for that week. We supply the omission now.

In using the blowpipe the flame of a lamp, candle, or gas may be used. The best flame is that by a lump with a large wick fed with olive oil. The smaller end of the blowpipe shoutd be placed within the flame, and, the wick should be slightly bent in the direction of the flame.
"The blowpipe flame consists of two cones; an inner of a blue color, and as outer, yellow. The heat is most intense just beyond the extremity of the blue flame. The inner fame is called the reduction flame, and the outer the oxydation flame. A mineral reduced to the metallic state by the inner, may often be oxydized, or combined with oxygen, in the outer flame, where it is in contact with the atmosphere. For oxydation, the beak of the blowpipe should have a large aperture, and the wick of the lamp should also be large; the heat usually requisite is that of incipient red.
To support the mineral in the flame, a piece of ciarcoal is generally used-the coal being carefully selected, well burnt, but firm; thal from pine wood being the best, $8 s$ it burns with the least ashes. A small cuvity should be cut in the surface, barely sufficient to receive the sulustance to be acted upon- $\mathbf{w h i c h}$ should never exceed, in bulk the size of a pea. Sometimes the substances to be acted upon are of such a natare that they will sink info and blend with the coal; in such cases a metallic substance. as of copper, silver, gold, or best of all, platina may be-employed. Coal is always preferable when it can be used, as the carbon of that material greatly assists in intensifying the heat necessary for the desired reduction.

Many minerals remain unaltered before the blowpipe unless some substance is added to aid in the fusion or reduction. These substances are called fluxes ; the most common and easily attainable of which, is borax.

From the above hints almost any person may, with a little practice, soon acquire considerable efficiency in the use of the blow pipe. Having become sufficiently expert in the use of this instrument as to decide upon the character of the mineral upon which he is operating, the amateur will naturally desire to carry his investigations a litile farther, and ascertain the proportion of metal contained in the ore upon which he may be operating. This may be ascertained in the case of any material which yields a regulus-(the button of pare metal, which, in the melting of ore, falls to the bottom of the crucible) and by an instrument so simple, that any person may make one for himself. Of course, it is always better that the prospector should be provided with the proper iustruments, which may always be obtained in any considerable eity in the country. But we are, just now, writing for the prospector, who may be at a distance from such
facilities, and who, of course, must be thrown on his own rescurces.
how to ascertain the proportion of metal contained in

## ANY QUANTITY OF ORE.

Take any common marsh reed, such as will yield a straight oint of eight or twelve inches in length-eight will answer very well. This joint should be carefully split, so as to form a trough through its whole length. Then take a narrow slip of very thin paper (that known as pony paper or bank post, is most suitable) the length of the piece of reed, and paste it upon a common carpenter's rule or any scale where the inches are marked off, (a scale of ten to the inch is better than eight.) It should be so pasted that, when dry, the divisions of the inch may be easily and correctly marked upon the paper with a fine poiuted pen. Previous to marking off the inches, it were well to draw, with a rule, two parallel lines the length of the paper and about $\frac{1 / 8}{}$ of an inch apart, and between these lines mark the divisions of the inch. This done mark the centre division line with an 0 [zero]; then commence each way, right and left, and number every fourth line from the centre to the ends, thus:
The fourth line each way from the centre should be marked 10 ; the 8 th, 20 ; the 12 th, 30 ; the 16 th, $40: \& \mathrm{c} . ;$ and a slip of 10 in . long graduated into loths of an inch, we have on each arm 50 lines, or $125^{\circ}$, taking 4 lines for $10^{\circ}$ or $21 /{ }^{\circ}$ ench line. While the linesiand numabers are drying, the exact centre of the reed trough may be ascertained, and marked right across by spots on the two edges. A line of gum-water, full $1 / 8$ of an inch wide, is then laid with a camel's hair pencil, or any convenient instrument, along the hollow ; and the paper being stripped from the rule (which it leaves easily), the graduated strip is cut out with scissors,
and laid in the trough, with the mark 0 (zero) exactly in the and laid in the trough, with the mark 0 (zero) exactly in the
centre. Being pressed close to the gummed reed, by passing the round end of a quill or avy other convenient instrument along it, it graduates the trough from the centre to the end. The graduation is very true, if well managed, as the paper does not stretch with the gum-water, after being laid on the rule with paste.
A very fine needle is next to be procured and passed
through a slip of cork, the width of the trough, about $1 /$ an inch square, and $1 / 8$ the width It should be passed through with care, so as to be quite straight. The cork should then be cut, until one edge of it fits into the trough, so that the needle shall bear on the edges, exactly in the spots that marked the centre, as it is of impoltance that the needle and trough be exactly at right angles to each other. . The cork is now to be fixed in its place with gum-water, and, portion of any soft resinous cement, on the point of a wire or knitting-neerle. A little cement being also applied in the same manner to the edges of the cork where the needle goes through, to give it firmness, the beam is finished. It may be balanced by paring the edges on the heaviest side, but accurate adjustment is needless, as it is subject to vary with the dampness or dryness of the air. The suppurt on
which it plays is a bit of tin-plate (or, in preference, brass whate), 多 of an inch long ano 1 inch wide. The two ends are turned up square $5 / 8$ of an inch, giving a base $5 / 8$ of an inch wide, and two upright sides $3 / 8$ high. The upper edges are then rubbed down smooth and square upon a Turkey s'one, letting both edges bear on the stone together, that they may exactly correspond. For use, the bram is placed evenly in the support, with the needle resting across the edg-
es. Being brought to an exact balance by a bit of writing paper, or any other substance placed on the lighter side, and
moved toward the end until the equilibrium is produced, it
will turn with extreme delicacy-a bit of horse-hair, 18 of an inch long, being sufficient to bring it down freely.

## This is used as follows:

A suitable portion for an assay, say 1 to 3 grains, of the mineral to be tried, is placed on one side of the beam, and counterpoised by a sunall weight, or any other substance on the other side: on No. 100 if the produce be required per cent. (but if per cwt., on No. 110 ), the assay piece being moved to or from the eentre until the balance is adjusted.
Its exact place on the beam being then noted, it is to be takIts exact place on the beam being then noted, it is to be taken of and reduced in the usual manner. If it require- roastmust be first heated red, that its weight may not chavge during the operation, and then be balanced by a separate weight from that which counterpoises the ore, and, is to be woved to indicate the changes in the assay; and, as in this case, the cupel must not be moved toward or from the e ntre, after being balanced, the powdered ore must be adjusted to its counterpoise weight, placed on 100, by taking out, or putting in a yittle, as the case may require, and not bv moving, as when no cupel is used.
When the reduciion is complete, and the particles of metal have been brought together into one bead it is allowed to cool, and then broken out of the roda (if any was used), is replaced on the beam precisely where it stood; or the loss or gain in roasting may be ascertained in the same manner. The counterpoise will now require to be moved toward the centre, in proportion to the loss of the assay. The number on which it stands, when the balance is restored, will give the produce per cent. or per cwt., accordirg to the first position of the counterpoise.

A beam of this kind is described in the "Annals of Philosophy," a graduated thin slip of deal, the needle fixed on with sealing-wax; but this is rather troublesome to graduate, the polish of the needle is apt to be impaired by the herat, its greater weight also interferes with its delicacy, and a blowpipe bead is very apt to fall off its flat surface. On these uccounts the reed beam is an improvement. Brass-plate is, however, where procurable, preferable to tin-plate for the supports ; and, still much better, two straight bits of fine glass rod or tube, fixed with cement on the edges of a groove, in a piece of wood of the requisite dimensions.
In making the trough, it will be found most convenient for use if it should be made about a quarter of an inch wide n the centre and rounded away to an eight of an inch at either end.

An equal weight of transparent glue and very strong vingar, with one quart of alcohol and a very small quantity of alum, dissolved by means of a water-bath, is said, by M. Bœttger, to make an excellent liquid-glue, very use/nl for uniting fragments of horn, pearl, shell, bone, etc.

Force of Ocean Swells.-Some idea of the tremendous power ezerted by ocean swells may be inferred from the fact, as reported by Capt. Trask, who has recently returned from the wreck of the Golden Gate, that the massive bower anchor of that ship has been found driven bigh and dry upon the beach fully seven miles from the locality where the ship was burned! The only portion of the wreck remaining was the forward part of the steamer, just abaft the boilers. Capt T. does not entertain the slightest idea that any portion of the treasure in the safe will ever be found. Abont $\$ 300,000$, probably in the possession of passengers, has been thrown upon the beach and appropriated by the natives.

## THE WATER BALAYCE

The Territorial Enterprise speaks as follows of an ingenjons mode of raising ore from some of the shafts in that locality :-
A cheap mode of hoistiog ora from the mines is found in the water balance, where a mine is so situated that this means can be employed, and there are doubtles places in the Territory offering conveniences for this plan of working. What is necessary, is a drain tunnel from the bottom of the main shaft, and a stream of an inch or two of water on the hill, that may be brought to the level of the top of the shaft Having these requisites, two large tubs, or a tank, with whatever contrivance may be deemed must convenieut and desirable for hoisting dirt, are suspended in the two compart ments of the shaft, by a rope workiug over a large pulley. Supposing the dirt tul or car to be filled at the bottum of the shaft, the empty water tank is of course at the top. By means of a small hose or spout the water tank is filled till its weight overbalances that of the dirt turb; when, very naturally, the former descelids aud the latter rises. The dirt tub being emptied, the water in the tank at the opposite end of the rope and bottom of the shaft is drawn off, and flows away by a drain tunael, allowing the dirt tub to descend to be again filled. Thus the operation goes on, ad infinitum, doing the required work at a very small working cost--neither is the first cost of the machinery more than a mere trifle in comparison with the cost of hoisting by steam machinery.

## Cotron and Tobacco in Ilinors.-This year, says the Call,

 has demonstrated beyond a doubt or question that the prairies of Illinois are completely adapted to the cotton plant and that the climate presents no obstacles to its saccessful cultivation. Large fields were planted to cotton in April and May last, and they sufficiently matured before the frost came, to be gathered, yielding an average of three hundred pounds per acre. Samples show that the staple is of superior quality, fully equal to the best "upland" that is grown in the most favored cotton districts. Satisfied with the success of this year's planting, companies of gentlemen interested in developing the material prosperity of the State, and individual furmers, are making preparations to commence the cultivation of cotton on a greatly enlarged scale next season. The question of cotton cultivation in Illinois as a new source of wealth, is considered as settled. Estimates by the loca paperi give 20,000 bales as the yield of the State this year. The crop of tobacco in Mlinois is unprecedentedly large. A correspondent says that as much as 2500 hhds. will be shipped from Carbondale, a section on the Illinois Central Rail road ; and that southern Illinois will send as much tobacco and hemp to market as the whole State of Kentucky. The millions of bushels of grain which the West exports furvish miniost the sole medium of cxchange for the staples and manufacturers of the old world, and until our political trous bles are settled this must continue to be the case.Consmerable quantities of cotton have been produced in New Jersey this year. The soil grows as much as 800 pounds to the acre. Before the invention of the cotton gin every New Jersey family raised its own cotton.

Tene following method of cutting glass is given in the Photographic News, by Alex. Taylor: "In treating of glass, I may give you another way of cuiting bottles, shades, or any glass vessel the neat thing you wish, and that is, to get a rod of iron heated to redness, and having filled your vessel the exact height you wish it to be cut, with oil of any kind you proceed to very gradually dip the red-hot iron into the oil, which, heating all along the surface, suddenly the glass chips and cracks right round, when you can lift off the upper portion clean by the surface of the oil. This never fails, and many a couple of bell glasses have I made in this from a sixpound confection bottle."

The Turpentine Manofactory, to which we alluded in opr last as having recently been established in Marysville, is, as we learn from the Appeal, owned by Messrs. Wait \& Jacobson. The enterprise, thus far promises a complete success. The gum obtained from the foot hill nut-pine answers admirably, and can be easily obtained in sufficient quantities, though it may be necessary to employ Ohinese labor to help gatherit. The enterprising proprietors will be on hand to secure the premiums offered by the Agricultural Bounty Bill, namely : for the first 10 barrels of rosin made in the State, $\$ 300$; for the first 10 barrels of pitch, $\$ 150$ : for the first 100 gallons of spirits of turpentine, $\$ 250$; for the first 1,000 gallons of spirits of tarpentine, $\$ 500$.

Mustard.-There was lately shipped from San Francisco 320 bags of mustard seed. The wild artiele of this country Is said to be superior to the best English, and the supply boundless.

## SAN FRANCISCO MINING NOTICES.

Charles Cany Mining Co.-An assesment of $\$ 150$ per share was levied on the stock of this'Company, Dec. 14th, 1862, payable on or before January 14th, 1863, at office, 338 Montgomery St.

## PROPOSED TAXATION OF THE MINES.

It is well known that a strong effort is being made by some of the leading politicians at Washingtou, to place a tax upon the mines of the Pacific Coast. The Secretary of the Interior, Mr. Chase, is in favor of either a tax or sale, and in a recent conversation witn our representative, Mr . Sargent, as detailed in the Washington correspondence of the Sacramento Union, expressed his opinion that the mines of California could be made to pay the eutire debt of the Union. Mr. Sargent urged upon the attention of the Hon. Secretary the manifest injustice of compelling any one interest to be especially taxed for such a purpose. The Secretary was evidently disturbed in his preconceived notions of mining taxation, by the cogent arguments of our representative, and finally referred him to Judge Edmonds, Commissioner of the Land Office, who has been deputed by the Secretary to collect information upon this important matter. The decision of Judge Edmonds will be final so far as the advisory power of the Department is concerned.
Mr. Sargent, with his usual alacrity, lost no time in presenting himself before the Judge, with whom he had a most interesting and important conversation of some hours duration, the re.ult of which was an evident modification of the Commissioner's views upon the matter, and a full agreement upon the two following important propositions :-
First,- That no nction of the Gover nment ought to be hat by which thowe now in posssssion of mining ctrims, devel oped by their labor or cap tal, or purchased by them, should

Second,-That no systern ought to be inaugurated that will lessen the production of gold, or be burdensome to the miners.
The Commissioner further agreed that no system of sale should be recommended which would allow the mines to fall into the hands of speculators. He expressed a desire to $f$ ster the mining interest on its present basis, at least so far as to eaable men of small means to engage in it, as now. He favored the idea of a license system, or percentage on the gross product. Mr Sargent promptly urged the injinstice and impolicy of taxing anything more than the net profits, and also reminded the Commissioner that even that was now reached by the three per cent income tax. That fact did not appeari to have been previously comprehended by the Commissioner! He remarked, however, that it should be considered.
As the Commissioner was il fexible in the opinion that the mines must be made to yield a special revenue, Mr. Sargent made it his chief aim to effect, to the greatest possible extent, a modification of the measurès to be proposed for the action of Congress. Having accomplished what he could directly, he then urged apou the Commissioner the propriety, before coming to any final conclusion in the premises, of paying a visit to California, and making a personal examination of the mines, and mingling and conversing freely with the miners themselves and our people generally, and thus learning for himself the pecerliar and anomalous condition of our mining community. The necessity of such a trip
to arrive at a correct knowledge as a basis upon which tn act in so important a matt $r$, appears to have been most successfully urged, as the Commissioner is reported, in his reply, to have expressed himself favorably as to the proposition ; hence we may reasonably expec a visit from him at an early day, and rely with much confidence upon the presumption that no legislation with regard to the mines will be advised by the Government, until the natter has be. $n$ thoroughly eaquired iato.
The reported action of Senator Latham, elsewhere refer red to in our issue, to-day, will not be likely to result in anything deffinite during this pendency of the proposed advisory action of the Government. Too much credit cannot be awarded to our vigilant mining representative, for the energy and diligence he uniformly displays in looking after the interests of his constituents.

Tunnelling in $W_{\text {asboe.- Deep tunuelling and other heavy }}$ enterpris' s are becoming quite common in Washoe, in connection with operations hitherto considered of donbtful value, while, at the same time the o!d tuncels are being pushed forward with renewed vigor. The Gould and Curry tunuel has now been driven in 1,350 feet-to midway between $B$ and C Street. Two thirds of this distance is through rock which does not require timbering. The ground is now getting soft and wet, and the drifters are evidently approaching the main Constock Lead, which the engineers expect to r ach within 150 feet and at a depth of 550 fe $t$ below the surface. Important developments are expected to be mude "hen this work is completed. The Latrobe tunnel is pro gressi $g$ at fair speed, the ground becoming softer as the drifters advance. The Monnt Davidson Company are still at work, and the long tunnel of the Ei Doradu, immediate'y south of the Mount Davidson, it is said will be pushed to the Montour Ledge, inside of three months; Work upon the Cedar Hill tunnel is also being vigorously prosecuted, and large expectations of important results are freely indulged in.

I he old Whitman Tunnel, in the Palmyra District, upon which work has been suspended for several months, is again resonant with the sound of the pick and bammer. This tuonel was driven to the distance of about 1500 feet, over one year ago, when work was suspended in consequence of the ledge which was struck being somewhat broken and of doubtful valu-. Since work has been recommenced, the drifters have found better ore. They are now taking out rock which is said to pay at t' e rate of $\$ 100$ in silver to the ton, and a.e in daily expectation from present anpearane-s of something better. The silver exists here in the chloride and sul,hate form, and in patches, not being found pure, or intermixed with gold.

Coal and Ironin Esmfralda.-E. M. Smith and J. F. McFarland, formerly of Stockton, but at present largely interested in mining operations on the other side of the mountains, have presented the Editor of the Sonora. Flag with specimens of the coal and iron from tie Juniata mines at Esmeralda, in which they are interested. The iron ore is a protoxide, a very rich and rare ore. These gentlemen assure us that there is a whole $m$ untain of this ore on their company's claim. The coal, as it is called, in our opinion, is a sort of petrified mineral pitch. It is very influmable, and generates a great beat. Its discovery in that section of the State is most opportune. The Juniata Coal Mining Company, orgamzed to work this new discovery, is regularly incorporated, with a capital stock of $\$ 500,000$. Of this Company, C. W. Kendall, F. Goodell and Albert Mack, all old residents of Tuolumne county, are the Trustees.

Tee Journal of the Franklin Institute states, that "hy incorporating into melted steel from two to five per cent. of Tungsten, there is obtained a steel which is, very dense, hard, and strong -admirably fitted for the manufacture of tools. The instruments made with this Tungs en steel are said to ke $p$ their temper four times as long as usual."
Mining Stocr Sale.-A sale of 1042 shares of Stock in the Sierra Nevada Silver Mining Company, is advertised, in the Territorial Enterprise, for sale to pay assessments to the amount of $\$ 10,211$. The Stock belongs to 57 different persons and will be sold on Monday, Dee 29, by John Middleton, at the Company's office, No. 40, Montgomery street.

INTERESTING EXPERIMENTS IN QUARTZ MINING.
A Mr. Porter, engaged in quartz ınining at Italian Gulley, near Ballarat. New South Wales has been experiment. ing upon tailings from his mill in the following manner. He placed 76 Hbs . if quicksilven in the boltom of a large retort, and then placed upon the quicksilver 225 tbs of tailings. The retort was then carefully closed, and placed upon \& furnace til! the quicksilver was all vaporized. It is argued that in this-manner the quicksilver is brought into immeriţte conLact with every particle of gold which was contained in the sand. The result alleged to have been obtained fron this experiment was so great, that, it is claimed if the samb can be obtained on tons as was here secured on hundred weght, it will be difficult to give even an approximate estimate of the increase to which the production of gold from quatz may be carried. At all events the excitement was so gre,t, in the immediate neighborhoud, as to cause a perceptible at vance in the price of quicksilver ! This experiment was an nounced in the London (Eng.) Mechanics Magazine, nearly a year ago. Whether it has resulted in any practical utility by experiments on a larger scale, we are not informed.
It is a fact, however, quite patent to all engaged in extracling gold from quartz, that a very large percentage of the precious metal is lost in the bungling processes generally ernployed in California, even in the most approved mills and plans for working gold quartz. During a recent visit ts Grass Valley, in Nevada county, we were placed in possess ion of certain alledged facts, which, if correct, are certain] of the griatest importance.
While we were there the mill which has recently been ted up in that place for working silver was made in rea ne.s for running. The proprietors, before putting in any the silver ore concluded torun it for a day upon some ref rock; which lay near by, and was supposed to contain b' small quantity of gold. The rock was known to be suc would not pay for crushing in the ordinary way for wor gold ; as a considerable qrantity of precisely the sathe of rock had been already crushed with a yield below the ing rate. It was thought, however, that there might bly be gold enough in it to charge the quicksilver, at an it would serve to scour up the pans, etc., and put the I good order to receive the rich ore which they were int to work from the vewly discovered silver mines. eight tons were put througl the mill, and to the as ment of every one, when the pans were cleaned up t ${ }^{\text {? }}$ exceeded $\$ 35$ to the ton! We were assured thr ${ }^{3}$ could be no mistake in the correctness of this expi; and results since obtained from simi ar rock from ${ }^{\text {e }}$ vein, whence the poor rock above alluded to was tal ${ }^{\text {e }}$ fully verified the first result. If there is no mistak ${ }^{\beta-}$ gard to this experiment, we are on the eve of ${ }^{\text {it }}$ important era in gold quartz mining yet attaire which will work a complete revolution in that braindustry, in California, and bring into high value th of leads throughout the S ate, which have hitherto onsidered as ent rely worthlest. We hope soon to mething still more deffinite in regard to the results obtained from the application of this new silver pr, the working of gold.
This mill is fitted up for working with the $S_{\text {Dew- }}^{\text {Dew }}$ ey process-a process, which, so far as we have ${ }^{\text {l, has }}$ never been used by any other than the Ophir ay, at Washoe; and although it has been considered. best claim to have knowledge of it, as not altoger best for silver, is nevertheless, we believe, acknow to be highly efficient for gold working. We can oal the the extraordinary yield above alluded to as the rits superior saving efficiency.

Gould \& Curry Mining Company. - At $t^{\text {al }}$ meeting of the stockholders of the Gould \& Cung Company, held on the 15 h instant, the followin Ball, A. elected, viz: John O. Marl, Thomas Bell, Ball, A. T. Lawton, A. B. McCreevy, William M. George
Hearst. At a subsequent meeting of the John O. Hearst. At a subsequent meeting of thr Company
Earl was.elected President. The affairs Coser were represented to be in a flourishing ar ${ }^{\text {erous con- }}$ dition.

Stlver Ore,-Eighty bags of Mexi er ore was brought up by the Oregon on her last tr tosted here.

## MINING NOTABILIA.

A correspondent from Grass Valley sives us encouraging reports of the progress of the work at the Girass Valley silver Mines. The onill is kept constantly rumning with equally
satisfactory rosults as those reported at the first clean up." The Central Conlpany were to have commenced raising rock' on Monday last. The direen Hurn Company is appecting to strike it rictier than ever when they get up with their tunnel. The stoupwa I Company, in another ledyre, near hy are driv are surface. Our correspondent is sanguine in the belief tho this new silver district will soon be developed to such an extent as to compare favourably with Washoe.
Fremonts Fistate.-A recent telegraphic dispatch from St. Louis states that Fremont has negnciations on foot to sell his Mariposa Estate to a large New York Stock Companyand that he will receive a sum sufficient to pay off his debts and have a million or two to spare.

Tue Wide West Mine.-A correspondent of the S. F. Neus Letter has examined one and a half tons of ore from this mine, which appears to be very rich. It was to have been worked in a few days, with some four tons more then on the way to a mill. This crushing will probably fix the value of the mine, and prove whether or not, the indications of its fabulous richness are reliable. Other important devel. opments are expected in that vicinity.

Mrs. Hall's Furnace-Mr. C. P. Duane, Agt. for Mrs. Hall, is now in Washoe and making arrangements for the erection, on a large scale, of one of these Furnaces, near Virginia City, when the practicability of this new invention will be fairly tested. By the usual modes of smelting ore now in use, about 100 bushels of coal are required to reduce a ton of ore. By this furnace it is clamed that the same work may be accomplished by the use of six bushels. Whould bat a small part of what is claimed for this invention be realized, it will prove, not only a fortune for the lady inventor, but a most valuable acquisition to California and the world.

The Sheba Mine.-A large specimen of silver ore from the Sheba Mine. Humboldt District, has been taken to Virginia City and placed on exhibition there. It is some three feet long, fifteen inches wide anil ten inches thick, with veins of pare silver branching through it in various directions. Another specimen of nearly equal size and thickness, was also orought in. We trust the mine may ever continue to abound in just such specimens.

New Development.-It is said that the Utah Company, Virginia City, have struck good rock. If this proves true, it will inspire new confidence in the extent of the Comstrck ledge. This Company, it is pretty generally believed, are working on that ledge, which will no dnubt, incite renew d energy in the development of claims lying between these and others known to be on the Comstock lead.

More Coal-Another coal discovery is reported in Oregon, about eight miles from Jacksonville, on Stewarts Creek. The coal is said to be found there in great quantities.

Singolar Gold Indications.-On the Hughes Claim, near Copperopolis, a kind of rock is found much resembling "c'inker." a substance abundantly produced in furnaces where hard coal is used. Imbeded in this clinker like substance are found sraall globules of gold-the entire appearance, no doubt having been produced by intense subterranean heat.

## [communicated.]

"Nemo me Inpune Lacrssit."-If there is anything the soft headed editor of the Mountain Messenger requires it is what is commoniy called "brains." We"refer that ind vidual to our list of sabscribers of leading officials, merchants. manufacturers and professional men, as published in 10-day's Scientific Press, who we ass rt are in every respect better qualified for thinking or reasoning, than the editor aforesaid. We advise him, that if his ill disposition will not allow bim him to help a good cause, to refrain at least from trying to intimidate it. If we had many such sluggards as the quasi editor of the Messenger, California would indeed soon sink into insignificance. "Nemo me impune lacessit. J. S.

Change of Publication Day.-The Publication day of the Press will hereafter be on Mouday instead of Saturday, ashertofore.

## A MINING BILL.

The telegraph has announcel the fact that Senator I $\Omega-$ tham has introduced into Congress a Bill intended ti govern ali $m$ ning operations, whether in Californin. or on the Eastern Slope. The announcoment appears to hive been quite unexpected in this state, and natura'ly enongh. creates considerahle curinsity if not an actual interest to know what may he the provisions of this new mining Bill. It is possibe that this Bill may have fur its orject the raising of revenue merely. as contemplatedly secretary C'hase, and elsewhere alluded to in our columus to-day, although the wording of the dispatch would seem to imply another ebject, referring more particularly to the internal police of the mines. Califorvians have ever expressed the desire that there should be no legislation regulating the mines on the Pacific Const. We have got along very well for some ten or twelve years under the "Rules and Regulations" adopted in our various mining localities, ald very satisfactorily interpreted by our courts. Perhaps Mr. Lathan may have devised some new method of managing the complicated mining interests of the Pacific Coast, which shall exactly suit the wants and necessities of the people. But the miners are, at all events, desirous of learning upou what basis our distinguished Senator would hereafter place these interests, and in the absence of such knowledge ara very fearful that, should any change in our policy be made, we shall all soon have occasion to regret that we had not "let well enough alone." To our compreliension it appears as though our national legislators had full enough to do withont attempting to disturb a system which certainly works well for the time being and any interference with which, we greatly fear will result in nothing but mischief and disaster.

## THE OPHIR COMPANY.

The Ophir Company has closed with Garrison \& Co., for the purchase of the Old Virgiaia Lead and the settlement of the pending suit between the two Compunies. The Vir ginia City Union says that orders lase been received in that place directing the agents of the Old Virginia Companyto pass over to the Ophir Co., the stock, books, etc. of that concern. The Virginia is no doubt a valuable mine, and probably well worth the money to be paid, aside from the important consideration of a final settlement of all matters now in litigation or likely to come up hereafter as to adverse title.
The receipts of this Company for the year ending Dec. 1st, 1862, have been $\$ 1,680,000$. The working expenses of the mine, during the same period, has been $\$ 746,000$. Expenses for extension of milling wor'ss, $\$ 80,000$, supplies on hand $\$ 250,000$, cash in Treasury $\$ 134,000-$
At the anaual meeting the stockholders held on the 8th inst., the following were elected as I'rustees: Joseph Woodworth, Charles F. Lott, Donald Iavidson; J. M. Livingston, A. E. Davis, Edward Martin and James W. Whi e. Alt a meeting of the I'rustees held subsequently, James W. White was elected President, and Thomas J. Lamb, Secretary.

Amende Honorable. - Several notices respecting miainy affiars as published in the Pre.s last week should have been credited to the Virginia City Daily Un on, a very excellent and valuable Journal with Dr. He ry Degroot as its editor.
The Copperopolis Railload.-Fifty-filty thousind one hundred dollars has been subscribed in Stockton to the cap ital stock of the Copperopolis Railroad.

Our imagination is likely to make our case worse or better than it is.

## Mining Stock Report,

San Frangisco, Dec. 18th, 1862.
The mining market at the present dates is steady with a moderate
 in the Nevada Legislatute, rad the probability of its receiving the governors signature is begining simply to effect low priced stocks.
Ophir sbares are in demand, with but little stock in the market. Only 124 shares were reported in Sin born's Circular, as sold last week, against 468 the week before. It can readily be disposel of for $\$ 2500$ to $\$ 2550$. At the Menting of Stockholders, elsewhere noticed, an ontiro new board of Trustees was elected, with the exception of C. A. Lott, who is continued. Gould \& Curry still continues to advance and has finally reached the higbest figure in the market, although it has not yet declared a dividead. It is firm at $\$ 2600 \mathrm{cash}$.
Chollar still remaius buoyant, having heid its adrance ot last week and is
quite firm ut \$350. Holders are con filunt of realizillg $\$ 100$ advance on Central is quated it \$1.400-a slight deprectailan.
Cithliomat is quated at \$1,200.
Potimi inas horefi hot tittle emyumed for. Small trausactions are quoted at om $\$ 60$ to $\$$ is-A deptre or $\$=0$
Nontha Putisi is quoted at $\$ 0-$ rffered at $\$ 7$.
Sierra Nevada is quoted at from $\$ 60$ to sif. Tbshares changed bande ast week.
Mancey is qutated at 8180 bid- 200 asted.
Huruing Mencow is quoted at frem $\$ 00$ lo $\$ 82 \frac{1}{3}$.
Mannt Iavilnou-100shares changed Landa at from $\$ 6$ to $\$ 8 \%-6$ alight аһร:แне
Meredith is firm at $\$ 20$.
Burnside is quated at $\$ 16$.
lowa quoted at $\$ 130$.
Norton is quoted at from $\$ 13$ to $\$ 17-\mathrm{a}$ slight falling off.
Sacramento is quoted at from $\$ 20$ to $\$ 24-\$ 30$ is assed.
Lucerno is not quoted.
Hale and Norcross is quoted at $\$ 250-\$ 300$ aqked. In the Bullotin's Stoek Eerort of yesterdry it was quosed as suld at $\$ 15-\$ 150$ askod.
Rogers quoted at $\$ 22 \frac{1}{2}$ bids- $\$ 27$ a-ked.
Lady Brymu-quoted at $\$ 3$.

## Esmeralda Stocks.

The Wide West is still adyaucing, and Is quoted at from $\$ 405$ to $415-$ 4202 g generally asked.
sutelope is quoted at $\$ 100$-with $\$ 110$ asked.
SEtua is not quoted. $\$ 8$ is asked.
Silver Hiil is quoted this week ut from 12 to 15 dollare- $\$ 18$ asked.
Utah has buyers at $\$ 20$-hetd al $\$ 30$.
Real Del Monte quoted at $\$ 25$ witu $\$ 30$ asked. An advance of $\$ 5$.

## Coso Stocks.

The Josephine bad bidders, the past weelk, at the Stock Bourd at from $\$ 15$ $\$ 15 \frac{12}{2}$-Hulders asking $\$ 20$ to $\$ 25$.
Coso-\$20 uskəd.
Willow Springs-heldd at $\$ 45$.

## Mexican Mines.

St. Nicholas Silver Mining Co. is qutoted by Sunbora's Circular at $\$ 100$.
Mina Prieta finds nu reoent buyers, but is held firm at $\$ 110$.
Dius Padre is quoted at from 30 to 33 dollars.

## WASHOE STOCK REPORT,

[Compiled from the Deily Territorial Eaterprise.]
The stormy and threatouing weather of last week, readering out donr exstcuce quite uncomfortable, neems also to unve exerted a depressing influence oll stuck transuctions. It is most probable, however, that the coofdence which holders feel in the increasing value of the miues, generally, has more influeuce upoustocks than cither tho weather or the apprebensons of buyers. Prices are steadily advancing, and holders are firm, two facts wheh argue a healthy confilence in the substantial weuth of the mocipal mining operations luow ia process of develonment.
Deep tunnel and other heavy mining cuterpr ises are becoming quite common in conncetion with explorations hilberto consilered of doubtiul value, while the old tannels are bang pushel forward with ronewerl vigor.
Very fuw of the sales nuw being quoted are at figures which fairly repreent the value of the ground conveyod.
The Pride of the Wust is eaid to be taking out the best roak from their mine that has over been struck in the Devil's $G$ to District. This claim thows a clagr e of parm wency which no other in that district has yet reached. Ciaims in Nigger Ravine, of this district, are begrouing to attract cousiderable attention amoug buyors. Prospecting has again conmeuced bere with reuewed euergy. Juch of the stock, however, which is unw crowding the market, frem this locality, ss nut regarded with much fuvor, and few seem dispuseal to nuerate in it at any price. Two years ago the edges of that distriut were largely dealt in, but developments, generally rell so far short of the general expectation, tbat capital now avoids the locality with almost too much severity.
Accoments from Paimyra enntinue to be of the most encouraging charac-
This District will, no doubt, prove a source of wealth to many whe avo lung coatinued to prospect there with little encouragement.
One hudred an 1 thirty feot of Humbolut stock sold, last week,
One hugdred as en an rage price of $\$ 050$, in small tots, ruoging from ten to thirty foet.
Five Dollars is affered for
Five Dollars is affered for Uuion, Gold hiil. The rock pow bejug taken rom this claim, is of a mucil better quality than any heretofore tuken from their mino.
A small lot of Waterhouse sold at $\$ 350$.
Several small sales have taken place iu Gold Hill at low figures.
The Nevada seems to be attracting less atlention than beretofore, although favorable uccounts continue to come in fiom thos, claims. Caledouia is euquired for at low Gigures. Thas Company has struck a rery furmidable lelge in their tunnel, which is also being rua for several other leiggos, which ure supposed to oxist further into the hill.
The North American frequently ehanges hads amoug the members of the Company, though but little is offered for sale in the martet
Baltic is offered at $\$ 25$ pur foot ; Ashland at $\$ 10$; Zouave offered at $\$ 10$ but withurawn.
Baltic and Uucle Sam have been in the market, the past week, at $\$ 20$; cole at $\$ 20$; Oriental at $\$ \pm$; Meretith at $\$ 15$; Sucramento is euquired for but nolle offered.
Santa Rila is in market at $\$ 42$, and El Dorado at $\$ 85$.
Cedar Hill Tuauel is offered at $\$ 550$; Durgun at $\overline{\$}+$; Gov. Ngeat 7 .
There wus but litle demand for auythiug, the past week, although almost anything could have beeu solu at a trife less than the rates asked.

The following stocks, not enumerated above, are in the market in Virginia City, and held at the figures annexed :-

GIFTS, DONATIONS AND SUBSCRIPTIONंS
To the work entitled "The Metalic and Agriculural Wealth of tee Pacific States." The publisher desires to thank the several gentlemen whose names are hereto appended, for their mrgnanimity and aid in behalf of this important work.

We have been favored, by the publisher, with the title page and prospectus of the quarto work entitled, "The Me talic and Agricultural Wealth of the Pacific States." The editor of this work has recently disposed of the "Mining and Scientific Press," with the riew of deroting his entire attention to the publication of the work; to this end he is makiug arrangements for an early v sit to the Atlantic States and Europe. The work if carried out according to the prospectus. will be one of the most valuadle publications yet presented to the public, and will prove of incalculable bene fit to California and the Pacific Coast generally, in bringing the immense mineral wealth of this region more prominent ly before the Capitalists of Europe. The object is a landable one and ought to be encontaged. Mr. Silversmith is one of our oldest citizens and is well acquainted with the subjects of which he treats. He desires but little aid and that we trust he will readily obtain. The following is the prospectus:

THE EYES! THE EYES!! THE EYES!!!

## DR. E. H. PARDEE,

Oculist and Aurist to the San Francisco Deaf, Dumb
and Blind Asylum.
After a protracted blindness of more than five years. Dr. PARDFE has made himself thoroughly and scientifically acquainted with all diseases of the Eye, and is now practicing with a success that cannot be surpassed in the United Siates : and a-proof of this he substantiates by many ca-es now in California that have been cured by hin, after having exhausted the skill of the eminent, physicians and oculists of New York city, Bostou aud Philadelphia.
From an extensive practical knowledge of more than 14 years, Dr. Pardee asserts, and is prepared to prove, that there lus been more blindness from bad and imy roper treatment than from disease itsell - how can it be otherwise when we take into consideration the effects of the old hacknied course of local treatment that patients undergo-Caustic to-day and Bluestone to-morrow-more painful than death, and always more tedious than the disease. Patients are daily presenting themselves with chronic cases, and on inquiring what had been formerly done, the almost invariable reply is, "I had my eyes hurned with car stic or bluestone;" 1 was bled and bistered, then cupped two or three times a werk-had a blue pill prescribed for me at bight, and salts in the morning-was ordered in a dark room-to keep my eyes tiohtly bandaged-to avoid the open air and exercise, with fifty other incousistencies, the aggregate of which is sure blinduess. Patients should be careful and not place their eyes at the mercies of a man who does nothing but burn them daily. not investigating the circumstances of each particular case, but ignorantly and blindly adopting and folowing theories the most erroneous, and destructive to the eye. How much more rational and consis ent to consult an experienced Oculist, who thoroughly understands every disease of this tender organ in all its aspects and varieties. Dr. PARDEE has from sixty to one hundred patients under his daily supervision, and, with but very few cases, they have all bee" treated by other physicians hefore applying to him-and all to no benefit. 'I hose wo are doubtial are permitted to call at Dr. Pardee's office and confer uith the many patients who convene there between the hours of 9 and 12 in the forenoon. The Dr. has a large and only assortment of Artificial Eyes on this cosist, inserted, having all the movements of the real eye, and that theylo $k$ so life like that no one can tell them, when properly inserted, frcm the real eye. These eyes are sold reasonable.
All the operations performed, such as "Strabismus," or cross-eyes-" Cataracts"-or removal of the Lens by absorption or extraction;-" Plerygium," or fleshy menibranes growing over the eyes. Artificial Pupils, \&c.

## FREDERICK KESMODEL, Cutler and Surgical Instrument Maker 81f KGARNY STREET,

Between Juckson and Washingtou streets,
SAN FRANCISCO,

R $\mathrm{R}^{\text {ECEIVED a diploma at the Fair of the Mechames' Institute, September, }}$ The atiention of thuse afllicted with HERNLA, or Rupture, or any one interested, is calleil to his new method of fitting and adapting Trusses to the difierent cuses. It is a well known fact that there has as yet been no syatem of fitting Trusses. There are many different siyles which have proven good
in many cases, but they are all uncurtain and eanuot be r lied on in many cases, but they are all uncortain addeanuot be $r$ lied ou, und in tages I chim fur these Trusses a jove avy and all others: First-The Pad is
forraed on the parts to be compressed by Laleng a plaster cast. Secund material, such as horn, itory, ete. Third-The Ined is so adjusted to the many other advantages. Examine and judge for yourselves it. There are

Our Mint, its Rules, Charges and Operations.
In the columas of a contemporary we observe some ex ceedogly interesting statistics of mint matters fur many years past, from which we glean the facts that the legal limit of wastage was $\$ 207,76699$ for the three years ending April, 1857, while the actual loss was $\$ 266,31286$, exceeding the limit some sixty thousand dollars. During the four years of Mr. Hempstead's Superintendency, the legal limit was $\$ 235,38639$; while the actual lost was ouly $\$ 4,52035$ being some $\$ 230,000$ less than the limit, and, in lact, a little under two per cent. of the amount allowed by law to be wasted. The wastage of the Philadelphia mint is twentytwo per cuht., against two per cent., wasted by our branch mint. The total expenditures for three years under Messrs Birdsall \& Lott, amounted to the large sum of $\$ 1.019,275$ 39. Under Mr. Hempstead, the total expenditures for four years were but $\$ 1,150,6+814$; while the difference between the last year of Judge Lott and the last year of Mr. Hemstead was upward of $\$ 100.000$ in favor of the latter. On retiring from the Superintendency, Mr. Hemstead left an unexpended balance of appropriation due the mint of up wards of $\$ 86,000$. This certainly is a capital- showing for our mint, and speaks well for Mr. Hemspstead's Superin tendency. Under Mr. Stevens, the present Superintendent, we have no doubt everything wil work in an equally satis factory manner.

For parting silver from gold when gold

16 Deposits for Fine Bars
$\$ 1$ 16-4-11ths cents. per standard ounce, 16 per ct gross value of silver for making bars; also when gold is contained t上 per ct. on gross value of gold for coining. Refining charges as in purchases.

Bars Sold From Refinert.
$\$ 1$ 2lets. per standard oz. 拍 per ct. gross value to be ad ped for making bars.

Deposited for Dollars
\$I 16-4-11ths. per standard oz. $1 / 2$ per ct. gross value for coining, when gold is contained, refining charge the same as in purchases.

## Deposited for Imported Bars.

\$116-4-11ths, cents por standard oz. $1 / 2$ per ct. gross value of deposit for making bars.
In regard to the deposits of Washoe silver, the rule will hereafter be, that the value of gold contained in the same will be paid in gold coin, and the value of silver in silver coin. The value of the silver will be calculated at $\$ 1.21$ per standard oz, and is exempted from the coinage charge, unless deposited for silver dollars, ia which crse a charge of $1 / 2$ per cent. will be made additional. Bullion of the above denomination will be entered on the gold and silver register, as most congruous with the physical aspects of the material, but in the warrant it must be marked that so much is to be paid in gold and so nuch in silver, according to the con tents reported by the assayer. The above rules, and charges were promulgated on July 10th, by Superintendent Robert J. Stevens.
U. S. Branch Mint, Noy, 6th, 1861.

On and ufter the 15 th inst., a charge varying in accord ance and the character of the deposit, from half a cent to three cents per oz.e, gross, in addition to the geveral rates, and be imposed on all bullion deposited for coindge or manufacture, which will require toughening or extra refining to render it suitable for mint purposes.

> Robt. J. Stevens, Superintendent.

## Regarding Patents.

We desire to call the attention of all those who intend applying for Patents, to our superior facilities for obtaining
the same. Our arrangements are such that we can hare all the same. Our arrangements are such that we can have all
the papers prepared,transmitted and returned, with the Patent Right, in three monthe from the time the applicant places the matter into our hands; thus saving at least three months delay.
The expense to the applicant would be rather less, if the business be done by us, than if the papers were sent to New York or Washington.
Thus by patronizing a home institntion, our inventive citizens can save both time and money.
We have prompt, intelligent and reliahle agents in the city of Washington who attend punctually to all Patent business sent to them. We hare agents, also, at London,
Paris. Brussels, Hamhorg, St. Petersburg, Berlin, Vienna, Paris. Brussels, Hamburg, St.
and other European capitals.

Pacific Patent Agency.
J. SILVEESMITH,
SOLICTTOR.

MINING AND SCIENTIFIC PRESS.
THE ONLT MINING, MECHANICL AND SCIENTIFIC
Paper on this continent.

## CORNS AND BUNIONS REMOTED.

DR. BYRON C. KENNEDY, practical Chiropodist, late of Philadelphia, would most respectfully inform the citizens of San Francisco that he has opened his office at No. 12 Montgomery street, opposite the Lick House, where he is prepared to remove all excresences, such as Coras, Bunions, Inverted Nails, Enlarged Joints, Swelled Insteps, Frosted Feet, Chilblains, Callosities, and all diseases of the Feet, without pain or inconvenience to the patient.
Dr. Kennedy also attends to Ganglion, or Scorbutic Ulcers, and all other diseases of the Skin. He may be consulted at his office, No. 12 Montgomery street, opposite the Lick House, from 9 to 12 A. M., and 2 to 6 p. m. Having devoted six years of study to this important, bat too much neglected. brunch of human knowledge, and having studied anatomy under the most skiiful and scientific Professors of Philadelphia, and having made this branch of surgical science my specia'ity for nine years. enables me to operate skil fully and saccessfully. In England, France and Austria the highest prizes are often awarded to practitioners in this branch of surgical science, and it occupies with others an equally lotty position in the profession.
Voizin is an illustrous example, a shining light, among the philosophical stars of Europe, and Dr. Byron C. Kennedy has fully equ:led him in this country, as a proof of which the Faculty of the University College of Philadelphia, Pa., complimented him with testimonials.
Dr. Kennedy has bent his earnest attention to the cure of these diseases, in which he has become so great an expert that be is now regarded as the leader in this country, in this branch of the profession, throughout the United States.
The following letter, which emphatically speaks for itself, was written by Dr. W. L. Sterens of the University College of Pbiladelphia
Dr. Broon C. Kzaneny: Dear Sir-Leardiug that you are going to take Your departure far Califorraia, and wiehing to inform the citizens of Phila.
delption aud also the people of the State of Californial the estem in which delphim and also the people of the State of Califiornia tio estcem in which
we hold you, and kuowing that nothug is more essential to your zuccess than the encouragemment whith you may recerve roment the people of phila-
delphin, in the midst of which is the placeround of delphia, in the midst of which is the plagground of your boghood, and
korwing that you have deroted years of siudy to this important but too much neglected branch of human krowledge; that you have attained to the highest rank in your prnfession, seroral of the Facuity and other prominent
citizens of Philadelphia having sulmited to your manipulation, we can recommend you with confidence to the citizcne of San Francisco, as one of the
mont skifful curgeons of the nge, and we hope your success may be such as most skilful curgeons of the nge, and we hope your success may be such as
will repay you for your years of study, nud that you may find a broad fleld or your exertio sin the new and growing city of the Pacific.

A JOURNAL OF MINING, AGRICULTURE, MANUFACTURES, SCIENCE, ART, OHFMISTRY, INVENTIONS, ETC.
VOL. VI. S.IN FRANCISCO, MONDAY, DECEMBER 29, $1862 . \quad$ NO. 9.

Tre upper of the three accompaning en gravings represents a perspective view of a new amulgamator recently patented by Mr. Zenas Wheeler, of this city, as it appears when at work.

The engraving upon the left represents the amalgamator opened. In the bottom of the pan M are seen the dies LLLLL. The inclined spiral ledges $K K$ on the side of the pan are designed to create an upward current of the pulp by which it is forced again to the centre of the top of the muller, and thence though a proper gpening, underneath the same, for re-grinding. Ihis current is kept up, so long as the machinery is in motion, and by thus constantly changing the particles, every portion of the ore js soon reduced to an impalpable powder, and in much less time than by the ordinary mullers, where no such current is established. The letters GGG G represent the muller raised from its place in the bottom of the pan with the face turned toward the observer, exhibiting a set of ehoes, which, like those in the bottom of the pan, are also moveable, and may be readily replaced when worn ont. The letters I I represent supports for the stationary wings D D D as represented in the engraving upon the right. The office of these wings is to aid in forceing the current of ore to the center of the pan as described above.

A, in the engraving upon the right represents the support of the inner end of the wings which are adjustable by the screw H upon the top of the shaft $\mathrm{C}, \mathrm{B}$ is the driver which carries the muller E. G G represent

an end view of the shoes on the face of the muller. F F are inclined spiral threads on the outer edge of the maller. which in connection with the spiral ledges on the pan create the upward current as before described.
The steam pipes represented upon the left of the upper figure are designed-the lower one to carry steam to the steam chamber, beneath the bottom of the pan for heating the pulp, and the upper one to convey the steam directly to the pulp in the pan.

We would call the especial attention of readera to the article on our second page under the head of "Electricity in Medisal Practice." After reading that they will lose nothing by perusing the advertisement of Dr. J. W. Vau Zandt, on the seventh page. We would also take occasion to say that the article alluded to has not been prepared at the suggestion of the Doctor, but solely with reference to the importance of the subject in a scientific and hygienic point of view. Should any of our readers, either medical or otherwise, entertain views opposed to those therein set furth, we should be pleased to hear from them, and will mast cheerfully accord them room in our columas.

There are at present in San Fhancisco five institutions in which Catholic youth are educated in the best and most complete manner, free of cost to their parents.

Welding Iron in Vacuo.-In a commun cation to the Academy of Sciences, at Paris M. Faye, according to Galignani, has given the following account of some experiments, in which M. Ruhmkorff took part. An iron wire was cut in two, and the ends brought into contact without any mechanical pressure: this done, by means of an electrical current the wires were heated to a dark red in vacuo, and they were thus instantaneously welded together. The wires were at an angle of 150 degrees ; and yet, with that inclination, they supported a weight of upward of three kilogrammes, before breaking at the point where the welding had been effected. The same experiment, made in the open air, by way of a counter-proof, led to no result, Encouraged by this success, M. Faye heated a thick iron cylinder in vacuo: it had been sawed in two, and the parts then joined together by two screws. The latter having inadvertently been made of brass, they began to melt dnring the heating process ; but although but a very small portion of the metal had actually become fluid, it penetrated by capillary attraction, aided by the vacuum, into the smallest fissures; soldering the two pieces with extraordinary nicety.

Silver in Tuolumne.-Reist \& Co.; pro prietors of an extensive quartz mill and a prich vein near Rawhide Ranch, in Tuolumne county, are putting up an improved apparatus for extracting the silver from the ore found in their rock. They have lately ascerta.ned that their rock is nearly as rich in silver as in gold.

Electricity in Medical Practice.
Among the many new and wonderful applications of Electricity, that of its recent use in the practice of medicine, is not the least important to the world. That this principle can be sucerssfully applied to diseased states of the system, in a large portion of the diseases to which human nature is more or less frequentiy subjected, is begining to be quite apparent to medical practitioners. That it is destined at an early day to be received as the great-looked-for necessity, to aid medicine in overcoming organic and functional derangement, and render its effect uniform and reliable, is bebecoming more and more apparent in the minds of all practicing physicians, who are willing to allow that every attainable truth with regard to medical practice has not already been discoved, and years ago reduced to practice and recorded in books of medical science.
"It is now established, beyond a doubt, in the minds of all liberal practioners, that the muscular contractions, which give action to a living limb or organ, corresp nd to currents of electricity existing there in appreciable quantities. That elecrricity is the living essence, that it is the vitality of all vitalities, that it is the great imponderable, subtle, circulating principle of life can be no longer questioned. In animal life the brain being the great battery, the nerve-cords, its conductors, pass from it and the spinal cord to every organ, tissue, vein and artery, runaing along with the great circulation of blood, imparting by its way its vitality, which enables the assimilation of all the principles going to sustain life, each to its proper tissue of the body.
If this is essential to life, how can diseased states of the system respond to medical agencies, when the great conducting, essential, and life-maintaining principle-Electricity -is not present or is broken in its current, or is wanting in its proper and healthy equilibrium? Surely the part must die without this great life-giving agency is first restored ; and when once alive, when the healthy current is restored, vitality is restored and the response of nature inevitable to the agences used for the relief of disease.
How often do we see the excited mind cure the suffering body. The sway of will thoroughly stirred into action often transcends the curative power of medicine; and what is this excited mind and sway of will, but the electro-magnetic forces of the battery of the brain, arousing and bringing into life the restoration of that absolute and requisite nervous fluid, upon which alone the energies of all parts of the system have being.

Who has not seen-what physician has not witnessed the death of men and women, when in their own minds they felt they could give no reason for such decease: that an examination after death would show no cause? Take for example the late decease of a certain bold and great original surgeon of this city. "What did the faculty say?. Why some were of opibion it was softening of the brain; and what is softening of the brain but the destruction of the nerve matter? All witnessed his life pass away, his usefulness abridged-all saw his sight stricken from him in a moment, and again restored after a time-that be was attended by the most eminent and skillful physicians of our city, and he died worn out-the great battery of nature was deranged in its action, the nerve cords of his body which course side by side with the arteries and veins to every organ and tissue, whose proper function and office it is to vitalize and give life to the properties of the blood, had ceased their office; for the reason that the great fountain of electricity, the battery of the brain, was destroyed, its equilibrium was lost, its action per-verted-and however correct the diagnosis of his attendants, his body could give no answer in response to medicines, for the great fountain of life ceased to enforce that energy necessary to the carrying on of health."

Thousands of lives go quietly out, every year, from nameless causes, which baffle every effort of the skillful physician -his medicines refusing to produce their usual effects, from causes entirely beyond the reach of his knowledge. In most cases of this character the experience of those who have adoptea the modern theory of the electro-magnetic and galvanic action constantly going on in the healthy system, tells them that the great disturbing cause is the diseased condition of the brain-battery and its attendant nervercords or conductors which can be reached and re-vivified only by an artificial applicaliun of this great life giving agent. The theory of Electro-galvanic treatment of disease, as an adjuvant
or aid to medicine is rapidly gaining ground. The everyday experience of those who employ this agent in a liberal and judicious manuer, is convincing inits effect, and conclusive of the inportant fact that it matters not from what cause disease originates, or how obstina'e the case, nor of how long standing; recovery by this mode of treatment, is more certain and more speedy than by aily other-for the electric current woill arouse the system from the depression caused by disease, which may have baffled the skill of eminent Sargeons ; to place it withiu the reach of ordinary medicines.

## COPPER.

An occasional correspondent of the Alta, of this city, recently gave a detailed account of the copper mines of Cala veras county, from which we condense as follows:

There are two principal copper districts in this county, divided by a low course of hills, but both in the same range. The one is known as Copperopolis, located about thrty five miles from Stockton; the other is known as the Gopher district near T'elegraph City, about twenty-nine miles from Stockton. The two localities are in some degree rivals.

## COPPEROPOLIS DISTRICT.

The "Union," and "Keystone" are the two principal mines in this district. Then comes the "Empire," the "Calaveras," the "Webster," the "Kentucky," etc.

The Union Mine is taking out ore at the rate of twenty to twenty-five tons per day, fifteen of which they are sending to this city for shipment. The Company is formed of thirteen shares of 150 feet each, principally owned by Lolor, Meader \& Co., and their Boston correspondents. The ore averages 20 per cent., and a dividend of eleven thousand dollars per share will be declared next [this] month. This mine employs 110 men and has very extensive improvements.
The Keystone Mine is shipping about one hundred tons per month. It is incorporated, with Mandeville, the late Surveyor General, as President. The shares of one hundred and fifty feet are held at a high figure.

Otaer Copperopolis Mines.-The Empire is believed to be a continuation of the Union lode. It is being thoroughly prospected, but is not yet upon the copper. The Webster, Kentucky, Calaveras, etc., are all in the same position, and offering every inducement for continued workings.
These mines about constitute the strength of the Copperopolis district. The Union is, of course, the back-bone, and gives employment to a great number of miners, timber cutterf, teamsters, etc. It is being admirably developed under the superintendence of Captain Hardy, and bids fair to be worth millions of dollars at an early day.

## THE GOPHER DISTRICT.

The mines of this drstrict are six miles nearer Stockton than the Copperopolis belt. A long mountain road is avoided, and a saving of two dollars per ton effected in hauling the ore.
The Napoleon Mine is located in the Gopher district one and a half miles South of Telegraph City. It is the principal mine in the district, and the only one regularly shipping ore. It holds 2700 feet upon the ledge, is iucorporated and is being dereloped with an energy and ability seldom equalled in mining operations. A village has sprung up around it; and the Company's houses, machine shops and steam works have gone up like magic.
It is stated that A. J. Moulder, the present Superintendent of Public Instruction, is to be the Superintendent after the first of January. Mr. Moulder is a thorough engineer, and the mine cannot fail to succeed under hus management. The Company is now taking out about 200 tons of ore per month, from a depth of forty-five feet. This ore is assorted and something over half of the whole amount is shipped. Cornish workmen are chiefly employed. The stock of this mine is all held in this city.
The Camp and McNulty Mrne is located about three quarters of a mile from the Napoleon. Very promising ore has been struck. Fifteen tons have been shipped as a test sample. Eight men are at work upon the mioe.

The Star Clain, between the McNulty and Napoleon, is as yet undeveloped.
The Live Oak Mine was originally located by Mr. Borch-
eighty feet. It is chiefly ownen in this city. The wolk upon the mine is being prosecuted with much energy by Mr. Botcher, as Superintendent. Its value is a mere question of time.
Tras Hugies Mine, at Quail Hill, is chiefly owned by Hiram Hughes, and is mined lor gold as well as copper. Mr. $H$. is developing this valuable claim according to his own views. It disp'ays a mass of rich carbonates of copper, and yielded largely in gold during last year. At present the workings are limited, but at a future period the value of this large deposit of mineral wealth will be fully appreciated.

New discoveries of Copper are constantly being made in this (Calaveras) county. The Calaveras Chronicle of Dec. 6th says a copper mine has recently been discovered at Hug Hill, in Salt Spring Valley, which is rapidly being developed and promises to become one of the riehest in the county. New leads are being found in the vicinity of Campo Seco, and the old ones are proving rich. The town is rapidly increasing in impoatance.

## copper in sonora county.

The Sonora Flug, of recent date, says that J. Oliphant \& Co. who have been engaged in prospecting for copper in the neighborhood of Montezuma, for several months past, have at last "struck it," at a place about a mile to the north of the town. The lead consists of two separate veins running parallel and close to each other, about eighteen inch es thick, each.
The Democrat, published in the same county, of late date says deep tunnels are being run tnto the Melones copper lode, and it is expected that the rein will soon be struck.
copper in placer county.
The Auburn Herald of the 13th inst. says:-"We were shown yesterday a specimen of copper nre recently discovered about seven miles from A uburn. Thrse who profess to know inform us that it is much richer than any that has yet been discovered in Copperopolis. It was an old Copperopolis miner who discovered the lead. He has already formed a company for the working of the mine

## COPPER SHIPMENTS.

The Napoleon Copper Mining Co. shipped, last week, sixty tons of ore to New York, by the ship Logan, This is said to have been the first shipment to that city. Boston having previously monopolized all the shipments to the Atlantic states.
Minerals in Maine-Very important mineral discoveries have recently been made in Maine, Canada and New Brunswick:
There is considerable excitement in the region of Lubec on account of the discovery of valuable metals and ores, esm pecially of lead and gold. Prof. Shepard, of Connecticut, is now prospecting for mines and minerals in eastern Maine, and the adjacent provinces. His opinion is that Washing. ton county is exceedingly rich in minerals. He says they have just struck a lead mine more valuaiole than any other one known in the world, far exceeding the Missourian mines which he has examined. He backs up his opinion by investments and shows his faith by his works, for he has purchased five thousand acres of land in the town of Cutler, which embraces five miles of seacoast.

Tax on Coal Lands.-The Commissioners of Internal Revenue have decided-lst. The owner or lessee of coal lands must have a dealer's license in order to be authorized to sell the product. Producers of coal are not required to take a manufacturers license. 2 d . Owners or lessees of coal lands who take out the coal solely for their own use, as manufacturers, must pay the tax, as the coal is used for consumption. 3d. Coal dealers whose sales are less than $\$ 600$, are liable to the daty; for not being manu'acturers, the provisions of section seventy-three are applicable. 4th. Wagoners who purchase coal by the load, from the dealers, to sell to customers, are to be rated as peddlers. 5th. Steamboats are not manufacturers. The same is true of cual barges.

Postage on Books.-It is not generally known that an act was passed at the last session of Congress reducing the postage on books sent by mail, to the rate charged fornews-papers-one cent an ounce in the State, and three cents when sent East. Heretofore the postage on books was the same as letter postage. Parties, therefore, can send books to their friends in the East, at a trifling expense.

## MINING AND SCIENTIFIC PRESS.

SAN FRANCISCO MINLNG NOTICES.
The Succor G. \& S. M. Co. will hold its annual Meeting, January bith, l8ti3, at its Ulfice, Nos. 1 \& 2, Montgomery Block.

Wide West Mining Co.-The Secretary of this Company putbishes an impurtant notice to stockholders, in the daily pap.rs.

Rueso River Mining Co.-Ten cents per sfare has been Iovied upou the capital Stock of this Company, payable Jan. 14th.

Hawley Mining Co.-Annual Meeting for election of Trustees will be held at Office 204, Front St., Jan. 5th.

San Francisco S. M. Co. have laid an assessment of $\$ 25$ per share, prayable on or before Jan. 1st, 1863.

Gazelle G. \&s. M. Co. will hold annual Meeting Jan. 7th.
Pacific Quicksilver Mining Co.-Assessment No. 3, of $\$ 1$ per share was loviod, Dec. 22, payable immediately.
Kuyst ine Copper Wining Co, advertise for preposals to purchase or treat 3 d quality copper ore. Proposals received till Jan. 15th.

Mammuth Ledge Mining Co.give notice of an assessment levied and payable ou or before Jan. 13th. Also that the first annual Menting fur the election of Trustees will be held at office, Jan. 17th.

Miners' Meeting.-At a meeting of the shareholders of the siegel Mining Compauy, it was resolved that a meeting be called of all the miners of the Siegel Miniag District, for the purpose of making laws by which said District may be groverned, and that said meeting shall take place on the 15 th day of January, 1862, in said Siegel District, iu or near a certain place beiter designated as the Siegel Min ing Company's Cabin.

Hale \& Norcross S. M. Co. have levied an assessment of $\$ 5$ per share payable on or befure Jan. 25th.

Curares Cant Mining Co.-An assesment of $\$ 150$ per share was levied on the stock of this Company, Dec. 14th, 1862, payable on or before January 14th, 1863, at office, 338 Montgomery St.

Live Oak Copper Mining Co.-Office, Montgomery Block - An assessment of thi, ty cents per share wus levied, Dec. 1st, 1862, payable in thirty days.

North Potosi Shiver Minina Co,-Annual meeting of Stockholders will be held on the first Monday in January, 1863.

An assessment of four dollars per share was levied on this 16th, 1863, at office, Cor. Batterg \& Washington Sts.

Merediti Gold \& Silver Mining Co.-An assessment of two and a half dollars per share (five dollars per fo $t$ ) was levied by this Company. Dec. 11th, payable immediately, at office, 712 Montgomery St.

Red, White and Blue G. \& S. M. Co. levied an assessment of 25 cunts per share, on the 10 th of Dec , payable with in thirty days, office cor. Pine and Montgomery Sts.

Bulcion G. \& S. M. Co.-The Stockholders are notified that they will hear something to their advantage by calling at the office of the Company, cor. Pine and Montgomery Sts.

Chdar Hill Tunnel Mining Co,-Anmual Meeting of Stackho'ders will be held at office, No. 5,
Cu's Bank. on the lst 'hursday in January.

Sirrad S. M. Co. will sell at anction, shares on which arrears may be due on Monday, Jauuary 5th, by Duncan \& Co

Norton G. \& S. M. Co.-An assessment of two dollars per share was levied Nov. 25, payable on or before Dec. 30 th , 1862, at office 522 Montgamery St.

Adriatic G. \& S. M. Co. will hold its annual Meeting of Stockhulders on Monday January 5th 1863, at No. 4, Amory Hall.

Willow Sprinas G. \& S. M. Co -The annual meeting of $^{\text {Will }}$ Stockh lders will be held at 224 Montgomery, on the 29 th of December, for election of officers.

Banner G. \& S. M. Co. has been duly organized. All claims or interests not presented for examination at office, 522 Montgomery St., on or before Lec. 31st, 1862, will be forever barred.

The fir-t annual meeting of the Stockholders of this Company will be held at their office, Dec. 24th, for the election of Trustees, elc.

Dios Padre G. \& S. M. Co.-An assessment of three dollars per thare was levied, Nov. 29th, payable on or before Jan. 1st, 1863, at office 502 Montgomery St.

Emamt G. \& S. M. Co-An assessment of twenty-five cents per share was levied, Nov., 2lst and is now due, and payable at office 326 Clay St.
Vibbard G.
Vibbard G. \& S. M. Oo.-An assessment of 25 cents per
share was levied, Nov. 21st, and is now due at office 326 Clay St.
Doyle G. \& S. M. Co.-An assessment of 25 cents per 326 Clay St.

Livingston G. \& S. M. Co.-An assessment of 25 cents
er share was levied. Nor. 21st, and is now due and ayable atoffice No. 326 Clayst.
lisac's G. \& S. M. Co-An assessment of 25 cents per
share was levied. Nov. 21 st, and is now due and payashare was levied, Nov. 21st, and is now due and payable at office No. 326 Clay St.
Kower G. \& S. M. Co.-An assessment of 25 ceuts per shar was levied, Nov. 21st, and is now payable at office 326 Clay St.
El Dorado G. \& S. M. Co.-An as zessment of one dollap per share was levied, Dec. 1st, and payable at office, on N. E. cor. of Ca!ifornia and Montgomery Sta., or to Snperintendent in Virginia City.
Iowa Mrning Co,-An assessment of Four Dollars per share was levied, Dec. 4th, payable at office 522 Montgomery St. on, or before Jan. 3d, 1863.
Josephine Mining Co.-An assessment of two dollars per share was levied, Nov. 19th, and is now due and payable at office No. 21 Stephenson House.
Buraside S. M. Co.-An assessment of one dollar per share was levied, Nov. 17 th, payable within 30 days, at office 712 Montgomery St.
Calmonia G. \& S. M. Co.-An assessment of 20 cents per sh ire has been levied by urder of Trustees, and all Stockholders neglectirg to pay on or before Ilec. 22d, will have Stock sold to pay the same on that day,' in front of the Post Office, Gold Hill. Office 412 FrontSt.
Hawley Mining Co. Ansesment
Hawley Mising Co.-Au assessment of 50 cents per share was levied, Nov. 15th, payable at once, at office 204 Front St.
Ambrican Quicksilfer Mining Co.-An assessment of one dollar per share was levied, Dec. 16 th, payable at Company's Office, in Petaluma, within 30 days- At the expiration of which time delinquent Stock will be sold.
Napoleon Copper Mining Co.-The first annual meeting of this Company will be held at office N. E. corner of Sacramento and Montgomery Sis., on Monday, January 12th 1863 , at 8 P. M.
Madison G.\&S. M. Co.-The books of this Company are open for issuance and transfer of Stock, at 608 Merchant St.

An assessment of two dollers per share was levied on the Stock of this Company, Nov.13th, payable at ouce.
Burning Moscow S. M. Co.-An assessment of Two Dollars per share was levied, Nov. 25, for the purpose of defraying expenses of steam pump and machinery now being
erected to drain the mine. Prompt payment is requested at the Company's office, corner of Mon'gomery and Jackson Sts., to Jos. P. Nourse, Sec.
The regular quarterly meeting of this Company will be held at the Company's office, on Wednesday, Dec. 24 th 1862.

## WASHOE MINING NOTICES.

Poornan G. \& S. M. Co--An assessment of Five Dollars per share was levied, Nov. 9th, and another of Ten Dollars per share, Nov. 21, payable at once to the Secretay, R. J. Mi:chel.
Coledonia Tunnel and Mining Co.-An assessment of Thirty-two Dollars per share was levied, Dec. 8th, payable immediately to the Secrelary, Martiu White.
The Vhmany Rock Co., lying next west of the Virginia
Co claims have notified the Hazel Green, Tiagley and Brach
\& Paxton Companys that they are tresspaesing upon the Chimney Rock Co's ground.
La Crosse Mining Co.-An assessment of $\$ 125$ per share was levied, Dec. 8th, payable at office 73 C Street, Virginia City.
Hawk Exe Silver Mining Co.-An assessment of 25 eents per foot was levied, Dec. 6th, payable immediately to S. A. Kellogg, Sec. Gold Hill.

Ashland G. \& S. M. Co,-An assessment of fitty cents per share was levied, Dec. 10, payable at the office of M. J. Power, Sec., B. St.
Independent G. \& S. M. Co.-The annual meeting of this Company, for electing officers, will be held at Gal: na, on the first Monday in January.

The Sierra Nevada Silver Mining Co. advertise in the Territorial Enterprise, 1042 shares of stock for sale for nssessments, on Monday, Dec. 29th. Shareholders will do
well to look to their interests. well to look to their interests.
Union Company, Gold Hicl-An assessment of fifty cents per foot has been levier, payable at the rate of ten
cents per foot, Nov. 15,22,29; Dec 6 , and 13, at the Com cents per foot, Nov. 15, 22, 29 ; Dee 6, and 13, at the Company's office, Gold Hill.
Norman Silver Minino Co.-An assessment of One Dollar per share was levied, Nov. 19th, payable on or before Dec. 31st, to the Superintendent in Virginia City, or at the office, No. 40 , Montgomery Street, San Francisco.
Martin White Mining Company.- An assessment of ten oents per foot has been levied, payable to the Secretary, at effice on $C$ Street, Virginia City,
The Speeney Co., Gold Hill, give notice that Baltic Company have wrongfuly claimed and worked their ground since July, 1860.
Moheqan Co., Cedar Hill.-An assessment of fifty cents
per foot was levied. Dec. 5 th; payable forthwith, to the Secretary at Virginia City.
Orisntal. G. \& S. M. Co.-The 3d asseesment of 15 cents per foot, was levied, Irec. 8th, und is payable at office, No. 31, C Street, Virginia City.

## ESMERALDA MINING NOTICES.

The Zenobla Lode Compasx, give notice that they claim a superior title to the Johnson Co., claiming the same ground, so far as said localities conffict. This ground is a portion of that now held by the Company known as the Wide West Company. The notice is signed by A. Waddell, J. C. Dorsey. S. P. Dorsey and James Elder,

## MINLNG AND SCIENTIFIC PRESS.

THE ONLT MINING, MECHANICL AND SCIENTIFIC PAPER ON THIS CONTHNENT.

## THIRD YEAR: VOLUME VI-NETY SERIES I

A yew Polume of this extensively circulated paper commenced Sent. 11, 1882. It is intended that every number shall bo replete with information concerning Mining, sicientitc, Me chanical and Iudustrial pursuits, togethel
with severul origiual engraviugn, of vew ioventions, otc, prepared expressly for its columns.

## This paper

If Science, Arts that may be of ingrieulture and Commerce, and any general information or tospare no pains or to the reader : and it is the intention of the proprieor lo spare no pains or expeose in making it

The Mixing Interess!
Will find it of grrat walue, as it will contriin all the nows anpertaining to aclaped to taiat purpose, and of every thung generally that may be of service to the Miner.

## Whe Inventor I

ato notice, of ascertaining the progress of inventiou in this invention ountries, and also of receiving any information that in this and otbor ob obtaining his patent, the premrietor having had great experience as a ain Patents with dispatch.

## The Mechanic and Manufacturer !

Will be greatly benefitted by its perusal, as each number will contan sev eral original engravings of new machines and inventions, together withe large amount of reading matter appertaining thereto. We are constantly recejving the best scientific jourals from all quarters, from which wo
shall continue to extract whatever may be of benefit or interest to our
To Chemists, Architects, Millwrights and Farmers l This journal will be invaluable. All new discoveries in Chemistry will be givell, and a large amount of information of great service to Arclitects and
Millwrights will be found in our columns. The Farmers and Planters will not be neglected, engravimss will be given of agricultural implements, and the farming interest generally will beamply discussed.

Ten Copies for Twelve Months, $\$ 30$.
Fifteen Copies for Twelve Months, $\$ 44$.
Twenty Copies for Twelvo Months, $\$ 56$.
For all clubs of Twenty and over, the yearly sul)scription is only $\$ 280$
Names can be sent in at diferent times and from Names cad be sent in at different times and from different
Specimen copies will be sent gratis to any part of the country.

## To Printers.

An Inreabst in one of the most floursihing and best paying Newspa. per Offices in the mountsins is offered for sale on easy terms. A rare op portunity is hereby presected toany printer desirous of extabliwhing himself in a geod business in one of the bealthiest, most thriving and delightfu! mountain towns in the state. For further information enquire at this office.

## THE AGE OF MACHLNERY.

We read of the "Heroic Age," of the "Golden Age," of the "Iron Age," of the "Dark Ages" and of the "Progressve Age." The latter term has been, not altogether without reason, applied to the present age ; but were we to select an epithet by which to characterise this age of ours, we should terin it the "Age of Machinert"-for such it is, in the fullest sense of tho term. The entire individual study of the present day is the adaptation of means to ends. Nothing is done directly, or by haud, which, by any human contrivance can be acconpplished by machinery. From the simplest operations in human industry, even to the most complex, some cunning, abbreviating process has been devised by the met chanical ingenuity of the present age. The Patent Office a Washington, within a few years, has become a perfect wilderness of labor saving contrivances, and displays to the astonished looker on, an aggregate of iuventive genius, which is absolutely bewildering.
Go where we will throughout the land ; notice whatever branch of industry we may, old modes of exertion are everywhere thrown aside, and the slow and feeble hand of the living antizan has given way before the speedier and tireless limbs of wood and iron which the cunning inventor has taught to work at his bidding. The shuttle has dropped from the hands of the drowsy weaver and fallen into the iron fingers that never tire, though they ply it many scores of times faster than it was wont to be moved. The farmer lays down the shovel and the hoe, the rake and the seythe, and steps aside for the multitudes of substitates now plyed by the power of steam or horses. The sallor furls his sail and drops his oar, while he bids his strong unweried servant with iron limbs and vaporing breath to bear him along the quiet river's bosom, or over the wildest ocean's swell. Even the horse is stripped of his harness and becomes laggard in his swiftest flight, as the swifter fire-horse, yoked in his stead, goes thundering along his iron way! The very lightnings of heaveu-God's grandest and most subtle agents-have been subdued, and brought to the aid of man, and taught by him to convey his thoughts from point to point, with a speed which not only equals but absolutely outstrips time in his most rapid flight! We have machines which, almost without the aid of human hands bore their way into huge mountains in search of hidden treasure or to make straight the otherwise devious ways of commerce ; again, they go down into the depths of the sea and dredge out its bottom, or attack the hitherto everlasting hills with a faith and force which causes them to remove at once to the sea and make thereof a smooth highway. We war with rude nature, and by our resistless energies come off always victorions.
Time was when commerce, with its white winged sails, ruled the world, and commercial position, alone gave power to nations. It was thus that Tyre, Carthage, Rome, Venice, and lastly England ruled the world by their cemmercial positions alone. Now all is changed. Tie Age of Machangry is tritempeant, and the genius of invention has -sought this western hemisphere for its imperial seat. The
wrooden walls which have hitherto been quite sufficient to protect the walks of commerce, and bid defience to a world in arms, are now as weak and feeble in comparisbn to modern enginery as the flapping sails which creshadow those walls in a calm, are to the almost resistless force of the gigantic machines which drive the huge steamers of the present day in their way across the deep, regardless alike of storm or calm. Wooden walls within the last year, have gone down forever before the iron clad ships, which the active genius of the American mechanic has brought to perfection as sudden and unexpectedly as the form of Hercules rose from the prolific brain of Jove. Thus it is that machinery now rules the world, whether in the arts of peace or war. The fate of nations will hereafter depend solely upon their attainments in practical science-in peace they must be able to contrive the most perfect machinery and apply it to the greatest variety of industrial parsuits-in war they most pos sess the means and knowledge 10 construct the moss formi dable engines of attack and resistence, and the heaviest calibre and longest range of guns.

## WHEELER'S AMALGAMATOR.

Upon the first page of to-day's issue will be found several finely executed engravings illustrat.ve of the new Gold and Silver Amalgamator recently invented by Mr. Wheeler, of this city. Mr. W., besides being a first class mechanic, has probably had more experience in the construction and running of quartz mills than any other person in California. He has here brought his practical knowledge to bear, nost successfully, in devising and constructing an apparatus for triturating gold and silver ores and amalgamating their met als. By an ingenious combination of certain well known principles, and the addition of several others that are new, and upon which he bases his patent, he has been able to introduce to the mining public a machine which needs only to be seen, by any practical miner, to be at once accepted as the ne plus uitirc of amalgamators.
The machine is already in successful operation in Washoe, at the Zephyr Flat Mill, upou Carson River, where it has been running for some months, side by side, with the most approved of other amalgamators in use, also with the most uniform superiority in point of saving efficiency, and of care and attention required in ruaving. One principle which is involved in this iuvention, and which is entirely new, is that the triturating and partial amalgation is effected in one machine, while the complete amalgamation and cleaning ap is confined to another, of entirely different construction. The first machine, only, is represented in the engraving which we give to-day, and may properly be called a "Triturator." The other machine, is called a "Separator," and will be illustrated as soon as the engraver can furnish us with the engravings. Twio or three of the "Tri-turator." are designed to go with one "Separators"
It is almost impossible, even with the accompaning engravings, to convey a very clear idea of the essential principles of the "Triturator." In order to be fully appreciated it must be seen. The model itself is sufficient to carry convic tion to every practical man, with regard to its utility and superiority. It is, however, in the combination of the two, and the new principles especially involved in the "Separalor" where the most important advantages of the invention are most readily discovered. Of this we cannot speak more fully until we are enabled to place the en gravings before our readers. Notwithstanding the complicated nature of the ma chine, nothing of the kind can be more simple in its construction or less liable to get out of order.
Money to Spare.-San Francisco has at this time a surplus of $\$ 300,000$ in her treasury, and the State half as much more. It has been suggested that the two amounts should be put together and invested in a monitor for the protection of this coast--trusting to Congress for its being refunded at some future time.
A. Heavy Rallroad Grade.-A railroad has been built in Nem Zealand fourteen miles in length, and rising in that distance 2,800 feet.
Buriron.-Almost nightly that huge wagon of Wells, Fargo \& Co. backs up to the express office, and discharges heaps of pure silver bricks, the product of the Washoe min-

## MINING NOTABILIA.

Our attention has been called to a bar of gold weighing $6 \mathrm{oz}, 8 \mathrm{pwt}$, taken from 3000 mb . of arsenical pyrites, treated at Deetken's Metallargical Works, near this city. We are assured that these pyrites, before being forwarded to Mr. Deetken were ground to an impalpable powder and subnitted to the usual anualgamating processes, all the gold being extracted which could be made to amalgamate with quicksilver. Mr. Deetken claims that the process employed at his works for the treatment of sulphurets, is far superior to any wet process. He is undoubtedly correct, and all mill owners, who are working rock containing a la ge amonat of sulphurets, will fiud it greatly to their advantage to save and forward them to Mr. D., who will work them for $\$ 20$ per ton. It is claimed that the yield by this process is from 30 to 50 per cent. higher than the usual processes of amalgamation. Mr. Deetken will set up at any mill, an apparatus for separating the sulphurets, for from $\$ 50$ to $\$ 100-$ no power or clean water being required to operate the same. The works iobmerly owned by Mr. D., at Grass Valley, in Nevada Co. are well known in that region, where they have established a good reputation. It is his intention that his new establishment, in this ctty, shall, if possible, reach a still higher standard.
A Valuable I Inscovery.-A rich and promising gold bearing lead of quartz was discovered last July, near Poverty Point, aboat two miles North of Placerville, by Mesers. Johu and Andrew Ellicott. The discoverers have organized Company for working the vein under the title of the New York Quartz Mining Co. The New El Dorado Gold Mining Co. have tuken up threp sets of claims, known as No.1,2 and 3, adjoining the discovery claim on both the north and south. The Companies are actively engaged in opening their mines and erecting mills. The mills will soon be ready to run. Several shafts bave been sunk upon different portions of the vein from 20 to 45 feet in depth, and El Dorado, No. 1 is running a tunnel. A large quantity of rock has already been raised, which is generally rich and well stocked with specimens. We examined a large quantity, last week, of very rich specimens which show much coarse gold. We trust the fortunate discoverers and their associates will find their "piles" in this new El Dorado.
Buchos.-The product of bullion from one hundred mills says the Virginia Union, is now cousiderably over a million of dollars per month, with the prospect of a rapid increase if things go on favorably. Several new mills are in process of building and will be finished inside of another month. A mong these may be mentioned the Gould \& Curry, and the large mill of the Daney Co . in addition equal to the production of half a million per month.
'Tee Ophir Company is running a tunnel through the length of their mine, 1400 feet, at a great depth from the surface. This work says the Virginia Union, when completed, sill no doubt demonstrate the inexhaustible wealth of the Ophir mine, and iucrease confidence in the Comstock lode. Already different companies have tapped that lode from the centre of Cedar Hill to the summit overlooking Gold Hill-a distance of one mile and a half. Throughout this entire distance its unquestionable richness was established.
Anoteer Silver Ledge.-The Quiney Unıon aays, Mr A. Robinson informs them that a ledge of silver rock has recently been diseovered near Eagle Gulch, in Plumas county, that prospects viery favorably.
The Grass Valley National states that some persons bave discovered a mine of the oxyde of maganese, which is very useful in the process of silver saving. It is worth eight cents an ounce.
Earthquake-Our citizens were pretty generally shaken out of their morning's nap, just before daylight on Tuesday last. Door bells were rung, plasteriug knocked down, etc., but no serions damage was done." The same shock was quite sensibly relt at San Jose.
Hoxaday Presents.-Messrs. Brauverman \& Levy advertise an extensive Stock of rich Holiday Presents, at their sales room, No. 621, Washington Street, in this city. Particular attention is called to their well assorted Stock of Jewelry, Silver Ware and Precious Stones.

## NEW BUSINESS ARRANGEMENT.

Mr. C. W. M. Swisu, having purchaced one half interest in the "Miniug and Scieatific P'ress," will bereafter be associated with us in the publication of the same. The editorial management will continue as heretufure. Mr. Smith will take charge of the business of the offee, and in that capacity, will call upon the mining and business portion of the city to obtaiu subscribers amolig sncts as are desirous of seeing a journal established in Sau Frrucisco, especially devoted to the great leading interest of the State, and to the general dissemination of practical knowledge among our people. Al ter s short stay in the city Mr. S. will visit the principal mining localities iu the State and neighborng Territury of Nevada, for the purpose of increasing the circulation and usefulness of the Parss. During his travels he will keep the readers of the Press apprised of the general condition and progress of the mining interest in such lucalities as he may visit. We bespeak for him a kiud and generous reception whersver he may go. either in the ci'y or ccuntry.
Perhaps it may not be inuppropriate, in this connection, to remind our citizens, whether directly engaged in mining or not, of the importance of establishing and sustaining at least one paper in the State of the character contemplated in the prospectus of the Mining and Scirntific Press. At the suggestion of quite a number of gentleman, anxious for the accomplishment of such a purpose, we have embarked in the enterprise, aud can assure the friends of the same, that the value and interest of the paper will be in exact accordance with the liberality of their patronage. The imaginar tion can scarcely comprenend the importance to which the legitimate mining interest of the Pacific coast may be car ried in the course of another decade. The mines of the Easteru Slope are even now beginning to furnish an impor tant portion of our monthly shipments of precious metals ; While the mineral developments on this side, other than gold, are already beginning to attract attention of European, as well as Eastern capitalists. The growth, in wealth and population, of San Francisco, will be limited only by the developments of our mines It is to be hoped then that her merchants, whether directly engaged in mining, or not, will yield a liberal support to a paper, whoge sole mission is, by the diffusion of practical information, and interchange of opinions and experience among miners, themselves, to aid in the proper and early development of this greas interest. It is furthermore important that a knowledge of the same should be placed before citizens, capitalis!s and working men abroad, to the end that our city and mines may be filled at an early dey, with those hardy sons of toil who will be quite ready to avail themselves of the opportunities and priviledges of our state, to escape from the tarmoils and miseries of Eastern and European communities. This they will do whenever these advantages are properly brought to their knowledge. Again we bespeak for our associate, a cordial and appreciative welcome, while he goes among our citizens and merchants, with the above objects in view.

Subscribe.-Are you a miner and not a subscriber to the Mining and Scientific Press? If so, you are an annual loser of many times the price of a year's subscription, particularly if you are engaged in quartz mining. The same amount of practical information, important to mainers and mechanies, which is contained in a volume of the Press, cannotbe bought from the shelves of any bookstore in the conntry for the price of several year's subscription. Do you ever send a paper to the "Old Folks at Home?" If so, and you desire to send important information and valuable reading matter, you can find no paper that will be read with so much eagerness by them, or one that will convey to them so full an account of the real industry of the country as the Mining and Scientific Press. We invite all to send us their names and four dollars, or two dollars for six months, and become patrons of the only mining paper printed on the Pa cific coast. Those who receive a paper with this paragraph marked may understand that it is sent to them for examination, and with the hope that it may so for meet with their approval as to warrant their subscribing for it at once. It is not our usual custom to receive a subscriber for less than
six months; but inasmuch as we are anxious to introduce six months ; but inasmuch as we are anxious to introduce
the paper where it is not now known, we will, for the present, send the Press for three months even, on the receipt of one dollar, in coin or stamps. It is our belief that no one will wish to disconaue the paper after being a constant reader of it for even that short time.

## THE NEW CITY

The unusually high water of last winter afforded a most excellent opportunity for the selection of building sites along our various valley streams, Among the numerous embryo cities and towas thus laid out, we know of no other which present more local advantages than the new city of Collinsville, on the Sacramento.
A glance at the Map of Californis is all that is necessary to satisfy any refecting mind of the judicious selection of this site. It is never subject to overlow, as the wharf and warehouses were built at the highest flood last winter. The vast region of fine country around it is fast filling up, and if the un interrapted navigation from San Francisco to Sacramento increases as it has done for the last five years, there is nu reasou why Collinsvill should not become sn important City, it being a midway stopping place for the steamers between San Francisco and Sacramento. Already, at and around Collinsville, there is a large number of inhabitants. They have a Post Office, Store, large Warehouse, and a fine Wharf, 200 feet long by 200 feet wide, which cost upward of $\$ 10,000$.
The farming conntry in Solano Connty cannot be surpassed. Fine soil, pure water, a milder climate, both in summer and winter, than almost any other part of California., A city with such a situation, surrounded by so desirable a country, cannot but have an early importance. A ferry has been established between this place, Antioch and N. York, making the distance only 35 miles, by land, to San Francisco.
The Company have donated one of the finest pieces of land in their city for a college and school house, to be finished by the first of May next.
Full information with regard to the place mey be obtained by enquiring at the Office of the Collinsville Land Company, 318 California Street, either personally or by letter.

John Nugent and Archibald C. Peachy have gone East to attend to the celebrated New Almaden quicksilver mine case, now punding before the United States Snpreme Court on an appeal.

## Mining Stock Report.

The mining market for the past week has not been very active, owing chiefly to the occurreoce of the Holidays. The sales at the Mining Board will be noticed above.

## REMARKS.

Opbre-This stock which, the week before, very materially declined and opened on Monday last at $\$ 2,150$, adranced carly in the week to $\$ 2,350$ cash
or $\$ 2,400$ on 60 days. Bites and Williams quotes sales, the past week, of or $\$ 2,400$ on 60 days. Bites and Williams quotes sales, the past week, of
312 shares The higtoost figures were obtained under the impression that a new and rich strike had been made in the mine, just north of the Mexican ground. The report not being confirmed, the stock was quiet during the latter part of the week.
The total amount of dividends mado by this Company during the last seven months has reached $\$ 470,000$, or $\$ 33571$ per foot. Under the close and economical management in prospect for the coming year, and the large amount of valuable ground now open for work, in addition to the increased capacity of the mill, it is but fair to infor will be largely increased the coming year. The Gorm \& CORRY declared a dividend on the 23d instant, of \$24 to the
foot, payalite on the soth. Thia stock has been lightly dealt in, the past week, but lithe belag in tho merket, Bates and Willame quotes sales of
 20 staree at $\$ 2,800$ on 30 days , and $10 \mathrm{ut} 86,700$ cash. The following are the 1802, sa per Avaual Report of the Eecretary from which we collato

Cash ou band, Dec. 16, 1861,

provemonta, cattle, working ores, etco, cto.
Casb on haud Dec. 18, 1862,

## $\begin{array}{r}\$ 889,14006 \\ 11,60272 \\ \hline\end{array}$

8000,743
A large quantity of ore from this mine, generally of inforior quality, has been worked the past year at several custom mills, with the following result, Amount recelved for oren worked and sold
Workiug expences on same

> Net probta pany, over
$\$ 2828,94646$
334,187 66
\$449,807 89
The balance of liabilities of the Company, over available assets, Dec. 1 kt , 1862, were $\$ 0,110$ 51. From that date to Dec. 24 was suficiecat to pay or that debt and declare a dividend or $\$ 24$ per toot-ffeoceforth we may set down the Gould and Curry as a regular dividena pay ing mine.
Chollar is quotod ut the Board the past week at the uniform rate of sasb -in Baves and Willian's Circular, the following quolations are given :- 20 shares at $\$ 360-12$ at $\$ 365-20$ nt $\$ 370$. The decision of the Supreme Court in the Choltar vs. Potosi is expected this week.
Potosi has steadily advanced the past week under the expectation of a comprorise. It has gone steadity up from $\$ 70$ to $\$ 100$, at which lust quotation Sundbora \& Co. quote a sale of 30 shares.
Sierra Nevada has adrancod $\$ 20$ on last weeks quotations, and reats at \$78. This advauce bas been caused by a report that very rich ore had been struck in the toine. Should this report be confrmed further adrancen may be looked for this week.

## Coso Stocky.

The Josephine had bidders, the past w3ok, at the Stock Bourd at from $\$ 15$ $\$ 15 \%$. -Hudders asking $\$ 20$ to $\$ 25$.
Coso- 820 asked.
Willow Springa-heldd at $\$ 45$.

## Mexican Mines.

St. Nicholas Silver Mining Co. is quoted" by Sanborn's Circular at $\$ 100$. Mina Prieta finds nu recent buyers, but is beld at $\$ 110$.
Dius Padre is quoted at from 30 to 33 dollare.

## WASKOE STOCK REPORTG

[Compiled from the Naily Territorial Enterprise.]
The Territorial Euterprise says that the pasage of the Incorporation Bill, created, at first, somethiog of a flutter in the Stuck Market, at Vir. ginia City; but as a large class of permaneut citizens, there, are satisfied that the Bill will eveutually work to the advautage of the mineral developmeat of the Territory, operators generahy look with complaicence upon any immediate disadvanhage, fully sutssied that money invosted in mines there wili be as amply protected under the Teritorial laws, as under the laws of Califotnia, The Enterprise intimates that the mines will be more rapidly develuped, more satisfactorily developed, more intelligently managed under the eye of a resident board of Trustees, than they ever could be under the past system of abseuteo managers-
We trust the speculations of the Enterprise may be correct, but we apprebend that time will ahow that the Nevadans have made an impolitic move, Sam Franciscaus will nol go to Wastone to live for the gake of inverting their money in the silver mines, be they ever so rich.
Accounts from the coal mines uebr Palmyra are of a more favorable and reliable charucter than at any time during the progress of their development. The developmenta which are now being made are such as tend to show in a more pructical manuer the real merits of the mides- The
Pioueer Company have taken upward of fifty tons of coal from their claims -An amount sufficient to thoroughly test the quality of the article-which has been used at severa! molls at Silver City, and is found 10 serve well for fuel, and is aftorded at less expeuse than wood can bo. This company is said to have prospected a sufficient amount of their ground to prove beyond a doubt the permanency of the miue. The ledge is nomo three feet in width, dipping at an atgle of forty-five degrees, rffording a better quality of coal the dueper they deaceud.
There appears to be less activity in stocks than usual, without a basis on which to calculate transactions. There will not, probably, be a general derand for stocka before Spring. Sales made during the Winter will be at rates equaily low as at prespnt.
Nevada, on the 16 th was offered at- $\$ 750$. A small transaction is reported at thene figures.
Inquiry was made for North American, but at figures below selling prices. Mount Davidson is offered at $\$ 6$-itha bighest bld, $\$ 450$.
Codar Hill Tunnel stock is offered at $\$ 8$. I is baleableat $\$ 5$.
Wyoming is quiet. Prospect for a ledge in these claims are less flatter. ing than on first discovery. The company continue to drive a cut in the direction of the supposed ledge, and will soon reach the point wherethe ruck was found on the surface.
The Savage (south continuation of the Gould \& Curry), a claim scarcely knowu in the San Francisco market, has suddenly leaped into notice and high favor, and fitiy fect wore sold on the 17 th uit. at $\$ 60$ por fcot-

GIFTS, DONATIONS AND SUBSCRIPTIONS
To the work entitled "The Metalic and Agricultural "Wealth of the Pactfic States." The publisher desires to thank the several gentlemen whose names are hereto ap pended, for their mrguanimity and aid in behalf of this important work.

We would call the attention of our readers to the Stock Report which we give from week to week in the columns of the Press. This report is very full and carefully made up from the most authentic sources, embracing all attainable transactions both in this city and in Washoo. Oar report, for this city, embraces a full statement of the sales at the Stock Board-each day's operations being presented in a tabular form. We also re-produce the substance of the several Mining Circulars issued in this city. In order to give each weeks's transactions, full and complete, we have changed our publication day from Saturday to Monday. We ibtend to make each number of the Press a full epitome of the mining intelligence of the previous week, and add thereto such matters of general interest and information as shall be thought useful and advantageous to the miner, the mechanic and, in short, to every seeker after useful and practical knowledge.

The Great Work by Julius Silversmith.-'The publish er desires to thank the following journals and periodicats that have made kind mention and said a word of encourage$m$ ent for his mission and his gigantic qudertaking. The journals alluded to are the Daily Alla Ciliformia, Herald and Mirror, Morning Call, San Francisco Abend Post, Mining and Scientific Press, Weezly Gleaner, San Mateo Gazelte, Solano County Herald, Dutch Flat Enquirer, Washoe Times, and Sacramentu Dispatch.
Sonething New.-A room has been set apart in the Occidental Hotel, of this city, as a branch telegraph office. the wires from which connect with the State telegraph office. several blocks distant. This arrangement has been devised for the convenience of the visitor's and occupants of the house, who may thus transfer their messages to any part of the Union without leaving the Hotel

## Important Publicaiton.

We have been favored, by the publisher, with the title page and prospectus of the quarto work entitled, "The Metalic and Agricultural Wealth of the Pacific States." The editor of this work has recently disposed of the "Afining and Scientific Press," with the view of devoting his entire attention to the publication of the work; to this end be is making arrangementsfor an early r 'sit to the Atlantic States and Europe. The work if carried out accordiag to the prospectus, will be one of the most valuadle publications yet presented to the public, and will prove of incalculable bene fit to California and the Pacific Coast generally, in bringing the immense mineral wealth of this region more prominently before the Capitalists of Europe. The object is a laudable one and ought to be enconraged. Mr. Silversmith is one of our oldest citizens and is well acquainted with the subjects of which he treats. He desires but little aid and that we trust he will readily obtain. The following is the frospectus:

 the fullowing plan and pronosition for the purrose of bringing huther from
Encludd, Frauce and Germany the workiup clusces, mechanics, artizans, mi

 thiny populatel stares and erritortes, thereby reductug labor, the eatab
lishing of fatorie, the occpation of the millions of acrea of arable laod
now ly ing dermant, and to work nur mines. The benefite accraing to our now ly mg dormant, and to work our mines. The benefits accroing to ous
Gorc. nment -10 matine conscyances- the methant- the manufacturer, the niniog cunpanines and profesional commumty, cinnot but be beneficial,
providel the facilities are offered in such emigrants, and accordmg to the provided the facilities are oflered In sucld emigrants, and according to the
tenor of our laws governing such. For these purposes the subscriber de-
sives to seek only the necessary or pecuniary and to tike hum ucross the Pa sires to seek only the hecessary or pecuniary and to take hum ucross the Pa.
cific and Atantic, so that he may be enabled to lay before the people of Eu-
rope a work whicl he has cumpiled from authentic rope a whrk whict he has compiled from autbentic ources, comprising the the mineral wealth of the Pacific thates, incluting partly Mcxico, Lowes
Catifuraia, British Columbia, etc., together with a synopsif of the climatology, agricutture, arts aud manufactures, with interesting statikies of our
imports expors, and pupulation. Also, the organsc acts of our State, the
ond local and geveral laws governing mining, the Preemptiou Act, and kindred
subjects pe taniug to the Pacific States. Tbe au hor resirving for himsel subjects pel taniug to the Preific states. The au hor rescrving for himself
the rigbt of translation of this work (which ban cost bim three years of his the rigbt of translation of this work (which bas cost him three ye
time to collect aud compile) in the GPrman and French langages.
He contemplates malking the tour to the Allantic States and Europe in
February or March, 1863 , and will equip linnself with the mineral materi als, fossil remains, etc., and illustrate them by diagrams and discourse throughout the Atlantic States ani Europe.
Such a work which your petitioner has in view cannot be published in this State without an extraordinary outlay, nor bave we the materinls, ar
tists or skill in copperplate or wood engraving. The work will compris from 400 to 500 prges , to be handsnmely illusirated with colored phates, maps, etc., quarto form. The subecriber will add thereto a complete lis
of all the assuciations and companies, especially mining companies. of all the associations and companies, especially minng companies. He goes to Eurepe for the purpose of seeing all the manufacturing pia-
ces, toachines and uteusils ; also to the leading mining districts and metal ces, machines and uteusils; also to the leading mining districts and metal
lurgical establishments, in acquire from the best sources there the best mode of trenting our rich minerals, and lay thtse several important feat
moder ures before nur penple through the Mining nad Scientific Press, and the
worls he hereby offers. But the most important subject in his mission worls he hereby offers. But the most important sabject in his mission is
the inducements he wall ofer to Europeabs of nur immensely rich minin the inducements he waln ofer to Europeabs of nur immensely rich mining
fields and agricnltural lands, together with the great advantages offered by The subsoriber, therefore, calls uphn tbe clizens in the Pacific states who
The have the interests of our new Etates nearest their heart, to aid bim in this graud but laudable undertaking with means. Each fubscriber will be
furnished with a copy of this work, which is designed to te use furnished with a copy of this work, which is desigued to be useful to the
tounting bouse, to the professional man ond miner. The nuthor desires to
state that whatever aid or subscription he may be furnished with by the people of this state he will refund atter the publication of the work, or leave the amount to be taken out iu books.
Respectrully submitted,

## THE EYES! THE FYES!! THE EYES!!!

DR. E. H. PARDEE,
Oculist and Aurist to the San Francisco Deaf, Dumb and Blind Asylum.

After a protracted blindness of more than five years. Dr. PARDEE has made bimself thoroughly and scientifically acquainted with all diseases of the Eye, and is now practicing with a success that cannot be surpassed in the United States ; and as proof of this he substantiates by many cases now in California that have been cured by hint, after having exhausted the skill of the eninent, physicians and oculists of New York city, Boston and Philadelphia.
From an extensive practical knowledge of more than 14 years, Dr. Pardee asserts, and is prepared to prove, that there las been more bliudness from bad and improper treatment than from disease itselt-how can it be otherwise when we take into consideration the effects of the old hacknied course of local treatment that patients undergo-Caustic to-day and Bluestone to-morrow-more painful than death, and always more tenious than the disease. Patients are daily presenting themselves with chronic cases, and on inquiring what had been formerly done, the almost invariable reply is, "I had my eyes burned with canstic or bluestone;"
I was bled and blistered, then cupped two of three times a week-had a blue pill prescribed for me at night, and Ealts in the morning-was ordered in a dark room-to keep my eyes tinhtly bandaged--to avoid the open air and exercise," with fifty other inconsistencies, the agoregate of which is sure blindness. Patients should be careful and not place their eyes at the mercies of a man who does nothing but baro them daily, not investigating the circumstances of each particular case, but ignorantly and blindly adopting and following theories the most erroneous, and destructive to the eye. How mach more rational and consis ent to consultan experienced Oculist, who thorougbly understands every disease of this tender organ in all its aspects and varieties. Dr. PARDEE has from sixty to one hundred patierts under his daily supervisjon, and, with bui very few cases, they have all been treated by other physicians hefore applying to bim-and all to no benefit. Those wio are doubtful are permitted to call at Dr. Pardee's office and confer with the many patients who couvene there between the hours of 9 and 12 in the forenoon. The Dr. has a large and only assoriment of Artificial Eyes on this coast, inserted, having all the movements of the real eye, and that they lo k so life-like that no one can tell them, when properly inserted, frcm the real eye. These eyes are sold reasonable.
All the operations performed, such as "Strabismus," or cross-eyes-" Cataracts". or removal of the Lens by absorption or extraction;-" Plerygium," or fleshy membranes growing over the eyes. Artificial Pupils, \&c.
OFFICE:-Clay street, above the Plaza-opposite Plaza Hotel—old Ňo. 217, up stairs. augl4.

## Attention! Attention!

A TRACT OF LAND, EMBRACING AN AREA OF 400 Acres has recently been surveyed and plotted out termsas any ever offired ly the various Homestead As-
sociations in our city. The tract is known as the "UnF versity Mound Survey," and derives sits name from the fact that the Directors of the University College have
selected a site of about twenty acres in the ceutre of the selected a site of about tweoty acres in the centre of the
fract for their College Building and Park- This property is more beautiful than any other ever offered in this market, and its location is puch that it must in the astural progress of improvement soon be in great demand
for places of residence. That this property will inerease for places n[ residence. That this property will increase Iovestments in Real Estate, it is well known, have paid as largely as any other, and insurance against riak
of depreciation in vaiue is secured by the sure and rapof deprecration in vaiue is se
id increase of our population.
Invest in Real Es gite, and Invest in Real Es ate, and you will ind it more profita-
ble than investing in wild-cat mining stock, or loaniug ble than investing in wild-cat mining stock, or loaniug money that may be prid in depreciated curreucy.
The prices for lots in the above tract wibl remanio unj-
form until after the holidays-that is, without interest. form until after the holidays-
Sho title to the land in perfect. For further particulars apply to HARVET S. BROWN, Lithographic Maps can be seou and had at the abo named office. no 136 mo

## NECESSITY FOR COOPERATION AMONG SILVER

 MINERS.We would call the especial attention of miners, especially those engaged in silver mining, to the following article which we clip from the Virginia City Union. The business of silver mining is one, above all others, which demands a high degree of scientifie attainment, the closest attention to its detail, and calls fur the fullest and most free interchange of experience among those engaged therein. The absence of mining schools, where men can be properly educated for mining superintendents and engineers, is already beginning to be sensibly felt among our people. It mast be conceded that we have but very few among us, who are properly qualfied to carry on, successfully and economically, this difficult and intricate branch of mining. In no way can the absence of such needful skill be so fully provided against, as by carrying out the suggestions contained in the following article from the Union. Will not the mill men and miners of Virginia City take the initiatory step, and effect an organization, for the above purpose, which shall be the forerunner of many such, on all parts of the Pacific Slope.

Our people are engaged in a pursuit, the working of silver ores of various character, that reqnires scientific knowledg of the highest order inasmuch as they are dealing with problems in chemistry which only the most experienced metallurgists and chemists can, at times, hope to solve successfully. We have tried dry and wet crushing; hot water in
the pans and steam in the tabs and pans; steam in false the pans and steam in the tabs and pans; steam in faise with arastra bottoms to deposit the amalgam in; much quicksilver and little; we use salt and sulphuric acid, sulphate of copper, muriatic acid, copperas, polash, soda, sulphate of soda, catechu, lime, pyroligneous acid, \&c. Now, who among all our mill men can tell the definite and specific object to be achieved by the use of any or all of these various processes and chemicalcals? We have tried the Veach, Sagebrush, Hatch, Patio, Smith \& Dewey, Jones, McCullough, Friebarg, and many other processes, and who among ut can tell which one is the best of them all and what are the comparative results therefrom obtained? Who can tell the chemical analysis of the ores of Gold Hill, Ophir, Gould \& Curry, Potosi, Silver City, Flowery, Humboldt, Veatch Mines, Esmeralda or Silver Mountain, all differing in chemical character, yet all silver ores and worked by the various processes in vogne in this Territory, the results of which whether successful or otherwise, are kept strictly private. Now thia is a short-sighted andstapid policy and should beat once sbandoned.
This business is one calling for all the lights of experienceand the resources of science-far more so than the working of the gold ores of California, that being nerely a mechanical operation. It mas be conceded that we have but few truly scientific men among us, and who could solve the questions proposed; nevertheless, it is only by admitting our ignorance in any case, and asking questions-seeking krowledge, that we can hope to solve any difficult problem. It seems to us that in the present state of mining and scientific knowledge, rouch good might accrue if the mining and mill men would form themselves intor society for their matual improvement ; just as the farmers in the Atlantic States form clubs, and meet say once a week or month, with certain definite subjects to be discussed, each one willing to contribute
to the conmon stock of knowledge that he bas gathered from his experience. So in the opening of mines or the working of ores from the various mines, whether the results are successful or not, we should know it; for it is not alone snccessiful results that point the way to safety,-we need to
know where the shoals and rocks are as well as the deep wa ter. Meetings of this sort might be made interesting and a means of great utility, if rightly carried on. With the present l.ng evenings men have much leisure, a porti
which might well be devoted to inquiries of this kind.
As at present conducted comparatively little useful knowledge is derived from our mining operations, each one work. ing apart, and keeping the results of his work to himself. One man knows little or nothing of the experiments made by his neighbor, and may be treating his ores to great disadvantage; whereas by the knowledge of some simple fact or agent in the possession of the other, he might attain to suc cess.
If by the use of any chemicals he can remove the sulphur from his ores, leaviug his silver a sulphate it does not follow that it will amalgamate with quicksilver, for his sulphate would be found by the application of salt to be beld in solution in the hot water in his vats. If the gold of the Gould \& Curry is associated with tellurium and will not amalgam ate, and he finds that some one mill man uniformly gets more gold from the same class of ore, but by a different process than he does, he has a clue that, followed up, may make "two blades of grass where but one grew before." If the Patio process is a success in itself, adapted especially to the Comstock ores, working them cheaply and with certainty of profitable results at all times of the year in this climate. we may find that out, or whether there are any insuperable difficulties in the way. If the Ophir, Central, Calitornia, Gould * Curry and others on the Comstock are, as I believe, shipping to Europe their first class ores, because the refults obtained by them are not sufficiently near to assay returns to justify them in working them bere in the present state o metallurgical science, but rather fu'ly justify the expense of shipment to San Francisco, the crushing there, perhaps, assay
and aale there, then we need to know it, for the difficulties do not alone concern the owners of the ores. They are matters of public interest-for the employment of labor here and incidental growth of the place are synonymous, and go hand in hand in every community; and as Americans it becomes us, if we have not the science to-day to achieve the results of the melting works of Europe, to have it by impurting the science rather than exporting the ores:

Bridging the Englise Channel.-Mitchell's Steam Ship ping Journal says a project for a railway ferry-boat from Dover to Calais will be shortly before the pablic. The ferryboat is to be 3,000 feet in length, 100 feet beam, and draw but 5 feet of water. In the centre of the deck will be a covered iron tunnel, into which the carriages will steam, with goods and passengers, to be conveyed across the Channel with considerable rapidity. The speed is to be 40 miles per hour. She will have rudders at both ends, and will never require to turn. Her build is to be that of a series of unsinkable tubes.
Another New Journal.-The California Wine and Wool Rogister is the name of a new 16 -page monthly journal, to be published at Sacramento on and after January 1, 1863, by J. Q. A. Warren, the well known California journalist-

Copper Mining Company in Nevada County.-A company has been organized in Nevada called the "Consolidated Gold, Silver and Copper Mining Company." It has located 30 claims on the lead, or 3,000 feet.

The Hesperian for January, has been laid upon our table. It is quite as interesting as usual, and especially valua ble to all interested in the fashions and polite literature. Accompanying the Magazine is the usual paper pattern which has come to be such a welcome monthly present to the la-

Subscribe.-A Are you a miner and not a subscriber to the Mining and Scientific Press? If so, you are an annual loser of many times the price of a year's subscription, particularly if you are engaged in quartz mining. The same amount of practical information, important to miners and mechanics, which is contained in a volume of the Press, cannot be bought from the shelves of any bookstore in the country for the price of several year's subscription. Do you ever sead a paper to the "Old Folks at Home?". If so, and you desire to send important information and valuable reading matter, you can find no paper that will be read with so much eagerness by them, or one that will convey to them so full an account of the real industry of the country as the Mins ing and Scientific Press. We invite all to send us their names and four dollars, or two dollars for six months, and become patrons of the only mining paper printed on the $\mathbf{P a}-$ cific coast. Those who receive a paper with this paragraph marked may understand that it is sent to them for examination, and with the hope that it may so for meet with their approval as to warrant their subscribing for it at once. It is not our usual custom to receive a subscriber for less than ix months; but inasmuch as we are anxious to introduce the paper where it is not now known, we will, for the present, send the Press for three months even, on the receipt of one dollar, in coin or stamps. It is our belief that no one will wish to discontinue the paper after being a constant reader of it for even that short time.

The news of the capture of the Ariel, which was telegraphed across the continent immediately after the arrival of the Constitution at this port, on Saturday last, created a decided sensation in New York and Washington. Senator Latham promptly introduced a resolution into the Senate to send a war vessel to protect the California Steaners. The Connecticut sailed from Fortress Monroe, on that errand on Thursday last. Government will either bring the treasure at stated times in a war vessel or accornany the steamers with an escort. New York and the East is more directly interested in this movement than California. For if our merchants cannot safely send their gold to New York, it nust of necessity remain here, which it canoot do without important bereflts accruing therefrom to the undustrial interests of this State.

Eaftern Timber for California-Oak timber is now being cut, in large quantities on the Mountains near Manchester, Vermont, for the California market.

Electrictity and Cbloroform.-An eminent French physician, at Paris, has discovered and announced to the world that an electric shock is sure salvation to any-hody dying from the effects of chloroform.

IT has been found on careful investigation that buildings often take fire from the hot air of furnaces, in consequence of the wood work being too near the register. Both hot air and steam pipes, if they come in contact with wood, will in time set fire to it , and persons cannot be too crefful in putting furnaces into their houses.

## MINING NOTABILIA.

The Humboldt Mines.- A full account of the progress of work upon the famuus Sheba mine of this district will be found in another column.

A correspondent of the Sacramento Union writing from Unionville in this district says that work is being vigorously pushed by the Mars, the Original, the Alamo, the National and the Oroville companies. The Original has taken out a large quantity of ore, and delivered a portion at Price \& Falls mill which has probably commenced crushing by this time. The National, also, has a quantity of rock at the mill. Much anxiety is felt to learn the result of these crushings.
The same correspondent has seen specimens of coal, recently discovered on the Emigrant road, at Rocky Ridge, on the Humboldt, about fifty miles above Unionville. The coal burns freely and is undoubtedly a valuable discovery. A company has been formed for working it, consisting chiefly of Sacramentans. In one of their shafts they have struck a streani of strong sulphur water, which is covered with a heary film of oil.
The Alrsal Mines.-The Alisal silver mine, recently discovered in Monterey county by Joaquin Torres, is located five miles east of the old mines, which were worked successfully in 1806 ond 1812. The vein was lost many years ago, and has but recently been recovered.
The Napa Qucessilver Mines, it is said bid fair to turn out very valuable. The severe storms of last winter damaged the roads to such an extent as to render it impossible to put them in condition for hauling machinery to these mines until late last spring. Nothing was indeed done in the way of obtaining a practical test till within the last six or eight weeks-during which time six retorts were put up and in twelve days retorted 162 flasks of an excellent quality of quicksilver. An additional number of retorts are about to be put ap, and other preparations are being made to work the mine or an extensive scale. The company are sanguine of having a "good thing."
The Reeese River Quartz Mines, according to a Simpson Park correspondeüt are very promising. New leads are being discovered and old ones bèing rapialy developed. A recent correspondent of the Virginia City Union has examin-
ed some very rich ore from veins discovered but a day or two previous to his writing, which he pronounces rìch.
Mineral Sale.-Tha editor of the Virginia City Union has recently examined some specimens of salt from a newly discovered deposit on the Washoe and Humboldt road, a large portion of which is nearly or quite pare. The deposit is represented as from 50 to 100 feet in width, and can be traced over a mile. Mr. Dickey, of the Ophir mine, gives it as his opinion that the salt is much superior to that brought from the Walker river region, and quite equal to the best from San Francisco. The location is very accessible. A company is now being formed to open and work these mines, which will undoubtedly prove very valuable. A large quantity of salt is annually consumed in the silver mines of Washoe, for the reduction of ore, and it is expected that this discovery will soon materially reduce its price. The location of this deposit is 100 miles from Virginia City, 100 miles from Reese River and 30 to 40 miles from the Hamboldt mines.
The Ell Dorado Cospany.-The Tervitorial Enterprise, of Dec. 24th says this company have struck very fine ore in their mine, some specimens of which it is difficult to distinguish from Ophir or Gould and Curry rock. This strike not ouly enhances the value of the claim in which it is made, but is encouraging to those owning veins in the same range, and will also operate to increase the price of feet throughout the entire neighborhood. There are one or two other companies in the immediate vicinity, that certainly stand a very good chance of finding the same rich strike in their mines

Californta Borax Company:-The articles of incorporation of this Association have been filed. The object of the incorporation is the mining and manafacture of boras, sulphur, and other minerals, in California. Capital stock $\$ 300,000$, in 300 shares, of $\$ 100$ each. Trustees: William O. Ayers, Lafayette Maynard, Solomon Heydenfeldt, and Frederick Billings.

Mining on the Colorado.-Rich mines are being discorered on the Colorado, from Chimney Peak to EI Dorado Canon; thence in a northwesterly direction to the "Slate Range." It is said by those who are posted that Washoe will before long find a rival in this section of the State. Within the last few weeks new veins of silver have been discovered in the "Slate Range," which yield most astonishing results. From El Dorado Canon rich veins, which were discovered over a year ago, have been thoroughly tested since J. R. Vineyard erected his mill there, and the yield is very great: The veins are numerous, and su far as tested, appear to be equally rich in both silver and gold. The mines on the Lower Colorado have not been so thoroughly tested, in absence of mills, as those higher up; but the assays are equally as good as any of the others.
Should these mines prove to be in the end as good as they now prospect, it will be the means of bringing a population to this region, with a spriniling of energy and capital, to keep matters moving. It requires some such contingency to regenerate this country and briog' into it a "people; the ma ority of whom are business men in the real sense of the word. Under such a state of things this section of the State will be really what it has been represented, and not the imaginary paradise it at present is.

Tae Savage Company.-The typee in our Stock Report of last week made us say that 50 feet of this Company, which adjoins the Gould and. Curry, were sold for $\$ 60$ per foot--it should have read $\$ 600$, a very material difference. A. large amount of work is now being done by this Company in the way of erecting bnildings, hoisting machinery, and making preparations for an extensive and vigorous working of the mine. The hoisting apparatus is the most complete and substantial in the Territory. The shaft is 12 feet by 4 in size, walled up with three inch plank doubled-grooved at the ends. There will be three compartments, each four feet squaretwo for ore, and one for pumping water. It is now down 170 feet, and will perhaps reach a depth of 250 when the lead will be tapped and worked from below.' The workmen have passed through the Comstock lead in going down, and are now twenty to thirty feet east of it.

The Humboldt Suver Mines.-Roughly estimated, it may not be far out of the way to estimate the namber of leads struck in the Hamboldt at 2500 -inclading the extensions already developed. But subtract from this amount any number which incredulity may suggest, and we shall have a sufficient number of paying veins which when fully developed will elevate this new mining region to an importance but little, if any, short of Washoe. When we look at the collective whole of the mining resources of the Western Slope, the imagination can scarcely conceive of its prospective value to our national progress. Developed and worked as this region soon will be, by the energy and enterprise of the Anglo-Saxon, it will far exceed in importance the rich fields of Mexico and Pera which, in their day, completely revolutionized the commerce of the world. Even when we look at it in the cold, calm light of business and philosophy, and allow the widest margin for difficulties and uncertainties, we can scarcely calculate the values that lie undeveloped in the barren wastes of the Western Slope:

Sllver Mountain.-A correspondent of the Virginia Union from this region speaks very encouragingly of its prospects, and narrates the following singular circumstance :
Messrs. Marks and Bradbury; while prospecting on the Esmeralda ledge in this District, came apou an old drill hole, with fase still in it, covered with debris to the depth of several feet; while three-fourths of a mile farther up the river, in the Monitor District, there is a shaft some ten feet deep, showing that these early prospectors, whoever they might have been, were aware of the existence of gold-bearing quartz at this place, but finding that it would not pay, and being ignorant of the existence of silver in the rock abandoned it.
Mr. Marks lately sold 100 feet in the Esmeralda ledge for \$1,750, to a San Francisco company, who are to ereet a mill bere in the spring for crushing the rock. Brandberry has sold out entirely, bat for how much I cannot ascertain, though it is reasonable to infer it was a large sum, as he was known to have plenty of money before leaving for the East. Placer diggings were worked near here from '55 to ' 58 , by

We desire to call the attention of all those who intend applying for Patents, to our superior facilities for obtaining the same. Oar arrangements are such that we can have all the papers prepared, transmitted and returned, with the Patent Right, in three months from the time the applicant places the matter into our hands; thus saving at least three months delay.
The experse to the applicant would be rather less, if the business be done by us, than if the papers were sent to New York or Washington.
Thus by patronizing a home institution, our inventive citizens can save both time and money.
We have prozopt, intelligent and reliable agents in the city of Waskington who attend punctually to all Patrint business sent to them. We have agents, also, at London, Paris, Brussels, Hamburg, St. Petersbarg, Berlin, Vienaa, nd other European capitals.
Pacific Patent Agengy.....J. SLLVeesmith,
Solictror.

## MINING AND SCIENTIFIC PRESS.

## SAN FRANCISCO MINING NOTICES.

Mina Prieta S. M. Co.-An assessment of $\$ 10$ per share was levied, Dec. 26, 1862-payable at office, cor. Montgomery and Jackion Sts., on or beforo Jan. 26, 1863.
Savage Mining Co.-The Annual Mecting of the Stockholders of this C 0 . will be held at Ullice, i12, Montgomery St. Jan. 13.
Union G. \& S. M. Co.-The regular quarterly Meeting will be held, at Office, 410, Montgomery St., Jan. 19.
The Madison G. \& S. M. Oo, advertise names of parties who are in arrens for assessments, and give notice that their stock will be sold on the 29th day of Jan. unless said assessments are previously paid.
Franco-Americano S. M. Co.-The following persons were elected ufficers at the meeting of trnstees, Dee. 26thChas. F. Gaian, Presuden and A. S. Gould, Secretary.
Sierra Nevada S. M. Co.-The annual meeting for the election of Trustees will be held at office Nu. 40, Montgomery Street, Jan. 12th.
St. Louis (f. \& S. M. Co,-Tue Annual Meeting for the election of Trustees will be held at uffice No.40, Montgomery st., Jan. 10th.
Lucerne Mining Co.-The Aunual Meeting for the election of Trustees will be held at Oflice 114, Battery St., Jan. 12th.

Central Silver Mining Co.-The Annual Meeting for the ele tion of Trustees will be held Jan. 13, at Office, No. 712, Montgomery street.
Lady Brgan G. \& S. M. Co.-Shares of delinquent stockholders will be sold at auction for assessments, at No. 400, Montgomery steet, on Jan. 27.
Desert Mining Co.-Shares of delinquent stockholders will be sold at anction, for assessments, at No. 400 , Mont gomery street, Jan. 27.

Wide West Mining Co.-The Seeretary of this Company publishes an important notice to Stockholders, in the daily papers.
Reese River Mining Co,-Ten cents per śfiare has been levied apon the capital Stock of this Company, payable Jan. 14th.
San Francisco S. M. Co. have laid an assessment of $\$ 25$ per share, payable on or before Jan. 1st, 1863 .

Pacific Quicksilver Mining Co.-Assessment No. 3, of $\$ 1$ per share was levied, Dec. 22, payable immediately.

Keystone Copper Mining Co, advertise for preposals to purchase or treat 3 d quality copper ore. : Proposals received till Jan. 15th.

Mammoth Ledge Mining Co. give notice of an assessment levied and payable on or before Jan. 13th. Also that the firstannual Meeting for the election of Trustees will be held at office, Jan. 17 th.

Miners' Meeting.-At a meeting of the sharebolders of the Siegel Mining Compauy, it was resolved that a meeting be called of all the miners of the Siegel Mining District, for the purpose of making laws by which said District may be governed, and that said meeting sball take place on the 15 th day of January, 1862, in said Siegel District, iu or near a certain place better designated as the Siegel Min ing Company's Cabin.

Hale \& Norcross S. M. Co. have levied an assessment of $\$ 5$ per share payable on or before Jan. 26 th.

Charles Cany Mining Co.-An assesment of $\$ 150$ per share was levied on the stock of this Company, Dec. 14th, 1862, payable on or before January 14th, 1863, at office, 338 Montgemery St.

Live Oak Copper Minina Co.-Office, Montgomery Block - An assessment of thi. ty cents per share was levied, Dec. 1st, 1862, payable in thirty days.
North Potoss Silver Mining Co.-An assessment of
four dollars per share was levied on this Company Dec. 11, 1862 , pasable on or before January 16th, 1863, at office, Cor. Buttery \& Washington Sts.
Meredith Gold \& Silver Minina Co.-An assessment of two and a half dollars per share. (five dollars per fo $t$ ) was levied by this Company. Dec. ilth, payable immediately , at office, $712 \mathrm{Montgomery} \mathrm{St}$.
Red, White and Blue G. \& S. M. Co. levied an assessment of 25 e-uts per share, on the 10 th of Dec , payable with in thirty days, office, cor. Pine and Montgomery Sts.
Bullion G, \& S, M. Co.-The Stockholders are notified that they will hear something to their advantage by caling at the office of the Company, cor. Pine and Montgomery Sts.
Simra. S. M. Co. will sell at auction, shares on which arrears may be due on Monday, Jauuary 5th, by Duncan \&
Corton G. \& S. M. Co.-An assessment of two dollars per share was levied Nov. 25 , payable on or before Dec. 30 ch , per share was levied Nov. 25, payab,
1862 , at office 522 . Montgamery St.

Basner G. \& S. M. Company has been duly oreanized. The firt annual meeting of the Stockholders of this Company will be held at their office, Dec. 24th, for the election of 'Irustees, elc.
The aunual meeting has been adjourned to the 9th of JanDios Padre G. \& S. M. Co.-An assessment of three dollars per thare was levied, Noy. 29th, payable on or before Jan. 1st, 1863, at office 502 Montgomery St.

Emasett G. \& S. M. Co.-An assessment of twenty-five cents per share was levied, Nov., 21st aud is now due, and payable at office 326 Clay St.
Vibbard G. \&S. M. Co.-An apsessment of 25 cents per share was levied, Nov. 21st, and is now due at office 326 Clay St.
Doytif G. \& S. M. Co--Arl nssessment of 25 cents per share was levied, Nov, 21st, and is now due at uffice No. 326 Clay st.
The Succor G. \& S. M. Co. will hold its annual Meeting, Tanuary 6th, 1863, at its Ollice, Nos. 1 \& 2, Montgumery Block.
Hawley Mining Co.-Annual Meeting for election of Trustees will be beld at Office 204. Front St., an. 5th.
Livingston G. \& S. M. Co--An aseessment of 25 cents per share was levied, Nov. 21st, and is now due and aya ble at uffice No. 326 Clay St.
Isaac's G. \& S. M. Co.-An assessment of 25 cents per share was levied, Nov. 21st, and is now due and payable at office No. 326 Clay St.
Kouler G. \& S. M. Co.-An assessment of 25 ceuts per share was levied, Nov. 21st, and is now payable at office 326 Clay St.
El Dorado G.\&S. M. Co.-An assessment of one dollar per share was levied, Dec. Ist, and payable at office, on N. E. cor. of California and Montgomery Sts., or to Snperintendent in Virginia City.
Iowa Mining Co.-An assessment of Four Dollars per share was levied, Dec. 4th, payable at office 522 Montgomery St. on, or before Jan. 3d, 1863 .
Josefuine Mining Co.--An assessment of two dollars per hare was levied, Nov. 19th, and is now due and payable at ffice No. 21 Stephenson House.
Burnside S. M. Co.-An assessment of one dollar per share was levied, Nov. 17th, payable within 30 days, at office 712 Montgomery St.
Hawley Mining Co.-An assessment of 50 cents per share was levied, Nov. 15 th, payable at once, at office 204 Front St.
American Quicrsilver Mining Co.-An assessment of ne dollar per share was levied, Dec. 16th, payable at Company's Office, in Petaluma, within 30 days-At the expiration of which time delinquent Stock will be sold.
Napoleon Copprr Mining Co.-The first annual meeting of this Company will be held at office N. E. corner of Sacramento and Montgomery Sts., on Monday, Jauary 12th 1863, at 8 P. M.
Madison G. \&S. M. Co.-The books of this Company are open for issuance and transfer of Stock, at 608 Merchant St.
An assessment of two dollers per share was levied on the Stock of this Company, Nov.13th, payable at ouce.
Borning Moscow S. M. Co.-An assessment of Two Dollars per share was levied, Nov. 25, for the purpose of defraying expenses of steam pump and machinery now being erected to drain the mine. Prompt payment is requested at the Company's office, corner of Monigomery and Jackson Sts., to Jos. P. Nourse, Sec.

## WASHOE MINING NOTICES.

Caution,-D. M. Tyrell warns persons against purchasing certain 10 feet of ground in the Wellington Co., standing in the name of J. B. Magee-also 20 feet, standipg in name of W. Williams. (See Territorial Enterprise.)
Asbland $\mathrm{Co},-\mathrm{I}$. A. Gould, in the name of the Moss Co. notifies the A shland Co. that their westerly drift has cut the Lambledge, in the Moss Co.'s ground, from which the Ashand Co. is forbidden to extractiany valuable metals.
Eldorado G. \& S. M. Co.-An assessment of one dollar per' ehare was levied, Ded. 31, 1862, payable, Jàn. 22; 1863, to the Secretary, at corner of Montgomery and California streets, or to the-Superintendent at Virginia City.
La-Plata Oro Co.-Gold Hill District,-An assessment of two dullars per share was, levied, Dec. 26 , payable at once,
at Officu of the Secretary, COurt-house Building, Virginia City.

Texas Co.-Tennessee Ledge.-An assessment of 25 cts. per foot was levied, Dec. 22, payable on or before Jan. 21, 1863.

The Regular meeeting of the Company for election of officers, will be held at the Comet Saloon, Virginia City, on Saturday, Jan. 21.
The North American Co., Gold Hill, will sell at auction,

Jan. 31, stock of shareholders delinqneut in payment of assesaments.
Grass Valley Co.-A meeting of this Co. will be held at the "Medan," in Viariuia City, on Thureday, Jav. 15.

Ashland G. \&S.M. Co.-Au aseesement of fifty cents per share was levied, Dec. 10, payable at the office of M. J. Power, Sec., B. St.
Union Company, Gold Hull-An aesessment of fifty cents per foot has been levied, payable at the rate of ten cents per foot, Nov. 15, 22, 29 ; Dee 6, and 13, at the Company's office, Gold Hill.

Norman Silfer Minino Co.-An assessment of One Dollar per share was levied, Nov. $19 t h$, payable on or before Dec. 31 st, to the Superintendent in Virginia City, or at the office, No. 40, Montgomery Street, San Francisco.
Martin White Mining Company.-An assessment of ten oents per foot las been levied, I ayable to the Secretary, at cffice on C Street, Virginia City,

The Sweeney Co., Gold Hill, give notice that Baltic Company have wrongfuly claimed and worked their ground since July, 1860.

Pomman G. \& S. M. Co.-An assessment of Five Dollars per share was levied, Nov. 9th, and another of Ten Dollars per share, Nov. 21, payable at once to the Secretary, R. J. Mitchel.

Coledonia Tunnel and Mining Co.-An assessment of Thirty-two Dollars per share was levied, Dec. 8th, payable immediately to the Secretary, Martin White.

Tae ('maney Rock Co., lying next west of the Virginia Co. claims have notifed the Hazel Green, Tingley and Biach \& Paston Companys that they are tresspassing upon the Chimney Rock Co's ground.

La Crosse Mining Co.-An acsessment of $\$ 125$ per share was levied, Dec. 8th, payable at office 73. O Street, Virginia City.
Hawie Eye Silver Mining Co.-An agsesement of 25 cents per foot was levied, Dec. 6th, payable immediately to S. A. Kellogg, Sec. Gold Hill.

Monegan Co, Cedar Hill.-An assessment of fifty cents per foot was levied. Dec. 5th, payable forthwith; to the Secretary at Virginia City.
Oriental G. \& S. M. Co.-The 3d aesesement of 15 cents per foot, was levied, Dec. 8th, and is payable at office, No. 31, C STreet, Virginia City.

## ESMERALDA MINING NOTICES.

The Zenobia Lode Company, give notice that they claim a supeiior title to the Johnson Co., claiming the same ground, so far as said localities conflict. This ground is a portion of that now held by the Company known as the Wide West Company. The notice is signed by A. K addell, J. C4 Dorsey. S. P. Dors y anc̀ James Elder,

## MINING AND SCIENTIFIO PRESS.

THE ONLY MINING, MECHANICL AND SCLENTIFIC PAPER ON THIS CONTLNENT.
THIIRD TEAR: VOLUME VI, - NEW SERIES 1
A uew volume of this extensively circulated paper commenced Sept. 11,
1862. It is intended that every uumber shall bo replete with inf 1862. It is intended that every uumber shall bo replete with information
concerning Minius, Scientific, Mechanical and Industrial pursuits, together concerning Mining, Scientific, Mechanical and Industrial pursuits, together
with soveral original engravinge, of new \{aventions, otc., prepared expressly with soveral orig
for its columns.
for its columns.
This paper is
This paper is devoted to the above purposes, together with the interests hat may be of interest to the reader : and it is the intention of the propriaor to spare no pains or expense in making it equal in interest and valuable nformation to any paper yet published.
Will find it of grrat value, as it will contain all the news anpertaining to Mining, the prices and sales of Mining Stocks, new inveatious of Machinery to the Miner.
thed

> The Inventor ! dium for to purpose

Will find it an excellent medium for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and also of receiving any information that may be necessary
in obtaining his patent, the prenrietor haviug had great expertence as in obtnining his patent, the preprictor haviug had great experience as a
Patent Agent, togelber with facilities at Washington that enable him to ob ain Patente with displatch.

The Mechanic and Manufachurer!
Will be greatly benefitted by its perusal, as each number will contan sereral original engravings of new machines and inventions, together with a large amount of realing matter appertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we
eball continue to extract whatever may be of benefit or interest to our
readrs.
To Chemists, Architects, Millwrights and Farmers i This journal will be invaluable. All new diseoveries in Chemistry will be given, and a large amount of information of great service to Architects and Millwrights will be found in our columns. The Farmers and Planters will not be neglected, engravings will be given of agricultural implements, and
the farming interest generally will be amply discussed.

Five Copies for Six Months, $\$ 8$
Ton Copies for Six Moaths, $\$ 16$
Ten Copies for Twelve Months, $\$ 30$.

verrisements, Fifty Cents per line. A liberal discount made to quarterly verrisements
advertisers.

## copper minting.

To those whose ideas of Copper Mining are associated only with the remarkable copper mining region of Lake Superior, where native copper frequently occurs in masses of many tons weight, and where its presence in smaller quautities is of almost every-day occurrence, the mines of California, with their yied of only 20 per cent, appear but poor in comparison. But when we compare our mines with those of Corawall and Devon, in Englaad, their richness, is most extraordinary. No advances have yet been made, in this city, on copper ore which assays less than 20 per cent. It is claimed that ores of less value are unprofitable for shipment.
The quantity of copper ore raised in Cornwall and Devon during a period of 126 years, ending with 1855 , was, in round numbers, $8,000,000$ of tons. During 70 years of this time the average yield of this ore was only eight per cent., yet copper mining was accounted a very profitable business, for both the miner and smelter. The average yield for the ten years next preceding 1785 reached the unusual figure of 12 per cent. During the period of 10 years preceding 1855, the yield fell to an average of only seven and a half per cent. The yield for 1859 was estimated by the authority betore us (published in 1857) at only $63 / 4$ per cent.-and yet the business was considered remunerative. Indeed in the vi.lage of Twista, in the Waldeck, copper ores are worked which yield only two per cent, and at Linz, on the Rhine; and several other localities in Germany, ores are worked which yield only one per cent, and from that to two-all worked in the gross! We propose to give a particular account of these cheap workings in our next issue, this article being too lengthy for them, to-day. Of course, ores of as low yield even as the general average in Cornwall, could not be worked, at present, in California, although we fully believe that by improvements in machinery, and reduction of wages by increase of population and reduced costs of living, the time will soon come when ores yielding from 8 to 10 per cent. may be profitably worked even in California.
The improvements which were introduced into the mines and smelt ng works from 1840 to 1855 kept the profits of the lower yields of the latter years fully up to those of the higher yields of former years.
The average yield of the entire mass of vein stuff raised in the English copper mines is estimated at only 3 per cent. The ore there, as well as in California, after being raised from the mine, is carefully assorted, not more than one quarter of the total amount going directly to the smelting works. The other three quarters being reduced by washing and assorting to a higher standerd of yield before it passes to its final treatment. Of the particular mode of treatment we propose to speak in a future number of the Press.
There is very little if any ore taken from the principal mines in Calaveras county which will not yield 5 per cent., and all the ore ranging from that percentage up to 15 or 18 per cent., averaging, we believe, about three quarters of the entire quantity raised, is thrown aside, as of too low a grade for shipment. The accumulation of these low grade ores at the Keystone, Union and Caleveras mines it is estimated has already reached 20,000 tons, containing fully $\$ 500,000$ worth of copper. The Keystone Company has advertised for proposals to treat or purchase this poor class of ore at their mine, and a correspondent of the Bubletin, calls the especial attention of experienced miners and metaliurgists to their ores. As remarked by that correspondent, we, also, are "satisfied that by means of water the ore can be reduced to the shipping value, or 20 per cent. A roller and jigging machine, driven by steam, would probably be all that is necessary to bring into market this immense quantity of copper. It may be that some process by fire might be advantageously used."
The lowest grade of ores in England and Germany, we bepieve, are chiefly worked by what is known as the "Linz Process"--first roasted and then treated with acids. Another process is also employed where the ores, after being crasbed, are submitted directly to an acid process, without any roasting. Both of these processes are there found remunerative in ores as low as two per cent.

The refuse ores now at the mines in Calaveras, will yi eld an average of from 10 to 12 per cent., which is from 5 to 6 times as much as the lowest grade of ores worked in England. It is but fair to presume that such ores will not long be considered worthless in California.

The Action copper mine, in Canada, the ores from which are transported to Boston for treatment at a cost of $\$ 6$ per ton, yielded an average of only 12 per cent., yet the net profits on this mine for the months of July, August and September of 1862 were as follows:-

This, it should be borne in mind, is the net profits of raising, transporting and selling the ore in Boston. No outlay is required for expensive reduction works, furnaces, \&c. A. profit of $\$ 36,747$ was realized from the above mine, in three months, from 12 per cunt. ore, sold by assay as we are now selling Calaveras county ore in this market; and yet it is expected that with further improvements at the mine, a much larger percentage of profits will soon be realized.
With such facts as these before us we nedhave no fears leas $t$ the value of the Copper Mines hitherto opened in California should be overrated. That they will soon prove quite as productive of real wealth to the State as the mines of either gold or silver we will endeavor to show in our next issue.

## THE SHEBA MINE.

The Sueba Mine, as is well known, is the "Ophir" of the Humboldt District. It is situated at Star City, and is now opened and being worked in a thorough manner, under the su pervisi on of Mr. Richard Powning, an experienced Lake Superior miner. We learn from a correspondent that two tunnels are now being ruo into the mine, one of which has already been driven a distance of 65 feet, and is 6 feet high and nine wide, thus offering ample room for the most extensive and economical working. About 150 tons of ore have already been taken out through this tunnel, ten tons of which were to have been crushed the past week, at the new mill just erected near the mine. We shall probably be apprised of the result of this crushing in a ferw days.
Only two shifts of two men each are now being worked; bat a rise upon the course of the lead will soon be commenced, which will give employment to some 12 additional hands, as stopers, who will be able to take out from 10 to 15 tons each twenty-four hours. The second tannel has been commenced 100 feet below the first and is already in about 40 feet. Stopers will soon be placed in this tunnel also. The mine is very favorably located for workiag, and will soon be able to give employment to fifty men, and turn out from 80 to 100 tons of ore each twenty-four hours. The prospects of this mine are certainly very flattering, and we trust the most sanguine hopes of the proprietors may be fully realized.

The same correspondent from whom we obtained the above particulars, informs us that Mr. Richard Homfray, late of Grass Valley, but now of Star City, has his mill nearly ready for starting.
As in Should Be.-Senator Latham has telgraphed to a party in this city, that Goverament had determined to dispatch an armed convoy with each of the California treasure steamers hereafter, so that no fears of any future danger of capture and confiscation need be entertained by loyal treasure shippers. This intelligence came too late, however, to allay the excitement with regard to treasure shipments on the last steamer; and shippers, as a general thing, forwarded their treasure to England. If, as has been with some reason suspected, it has been the hope of English shipowners, by means of their piratical "Alabama" to change the ccarse of California's golden stream from New York to Liverpool, they have been for the time being, successful. But so soon as a government vessel shall be known to be in readiness to perform the assigned duty, the treasure will again assume its wontedjchannel, and the odium which the inglorious career of that "freebooter" has so justly attached to England, will have to be endured, with but the merest moity of the paltry thirty pieces of silver for which she has sold her national honor

Good brown paper is now manufactured at the Salisbury Paper Mills, in Orange county, from "cat tails," the product of the wild flag growing in low grounds all over the North.

Meeting of the Legislature.-The State Legislature meets at Sacramento, to-morrow. It is to be earnestly boped that the present body will profit by the experience of past Sessions, and so diseharge the great trust committed to their care as to merit the approbation of their constituents, and materially advance the varied interests of the State. The election of a United States' Senator, and a suitable demonstration of the loyalty of our State and her carnest desire to do what she can to strengthen the arms of the general Government in its present terrible struggle with treason, are the two most important matters which will come vefore the present Session. The only further important duty of that body will be to devise waye and means to foster, encourage and stimulate the great industrial interests of our State, As the special advocate and representative of the great leading interests of miuing and mechanics, we shall take especial pleasure in receiving from members orders to supply them with copies of the Peess, during the Session, believing that they cannot fail, from time to time, to gather from onr columns valuable and practical hints which may be of service to them in shaping such legislative action as may have a bearing upon the important interests which we represent. With earnest wishes that the session may be particularly valuable to the State and honorable and agreeablo to themselves we wish them the heartiest complements of the season.

A company has been formed in Greece for the purpose of cutting a canal thirty-four yards wide and six deep across the Isthmus of Corinth, in order that the dangerous voyage along the coasts of the Peloponnesus may be rendered unnecessary. Such a canal was often contemplated, and was even begun, in ancient times, but it has never been formed.

Repairing the "Moses Tarlor.-The opposition steamer Moses Taylor has been hauled into her berth at Mission St. wharf, and repairs upon her engines are being rapidly pushed forward. A new foremast will be placed in her, and the rigging, spars, etc., are to receive a general overhauling. The Taylor will beready to start for Panama on the 21st of January.

Effect of Music on thes Sick.-The effect of music on the sick has been scarcely at all noticed. In fact, its expensiveness, as it is now, makes any general application of it out of the question. I will only remark here that wind instruments, including the human voice, and stringed instruments capable of continuous sound, have generally a beneficial effect.-While the piano-forte, with such instruments as have no continuity of sound, has just the reverse. The finest piano-forte playing will damage the sick, while an air "Home, Sweet Home," on the most ordidary grinding organ, will sensibly sooth them, and this quite independent of as-sociation.-Florence Nightengale.

## Mining Stock Report.

REPORT UF SALES
At tho San Framelsod Mining Stock Board, For tho week uadiag Deeember 27, 1862.
 past week.
Ophir opneed at $\$ 2,300$ and closed at $\$ 2000$. The depreciation has been caused in part by the report that the mino presents a less favorable appearance thu for some monthe previous, and to some extent by the prospect of light dividends for some months to come, in consequence of the payments to bo made to tho Virgiuia Company, and from other causes, ail of a temporary nature. The Directors will meet to-morrow to declare a mouthly dividead.
Gould \& Curry commenced the week at a decline of $\$ 50$, but closed firm at old rates $\$ 2,700$. The tendency of this Stock is to advance. Much speculation is indulged in with regurd to futuro dividends. January dividends have been sold as high as $\$ 75$ and $\$ 80$ per foot. Ten stamps and four amalgamators have been started in the Company's mill, which work sutiefactoriIy. The first bar from the mill wass abipped for this city on the 31 st ult. It was valued at 81000 The entire 40 stamps, with the complement of amalgamators will be put in operation during the present week. The or aults of thoir work will soou determine the actual value of the btock.
Chollar is still in demand at from $\$ 350$ to $\$ 365$. Shares are in de
$\$: 60$, and there is not sufficient stock offered 20 eupply the calls. 8360 , and there is not suffecent stock offered to supply the calls.
Potosi.-The decision of the Supreme Couct in the case of tho Cl
Potosi-The dectsion of the Supreme Court in the case of tho Chollar rs.
Potosi will probubly be rendered to-morrow For some reason or Potosi will probubly be rendered to-morrow .For some reason or other the impression seems to prevail that it will be fuvorable to the latter ; hesce the adyance of its stock the past week from $\$ 90$ to $\$ 110$. Five abarea are quoted by Bates \& Williams at $\$ 120$ per foot.
Savage is in demand at $\$ 600$. Very little stock is offored. The annual meetiug of stockholders for the clection of Trustees will be beld on tho 13th inst. (See item in 2nd column, 2nd page, in reference to this Compauy.) at previous quotations. There appesrs to be a desire for speculation in this stock, which will probably rua it up to higher figures tise coming weelk.
Burning Moscow is in demand at slightly advanced rates. It has been uoted the past week as high as $\$ 621 / 2$
Mount Davidson is stlll quoted at old rates.
Charles Caney in demand at $\$ 17$-dull at its highest quotations, $\$ 20$ Meridith exhibits a ulight decline, but bus many friends.
Iows is quoted from $\$ 130$ to $\$ 140$. In demand at $\$ 135$.
Wide West (New Stock-consolidation with Johnson Co.) Is quoted at from $\$ 265$ to $\$ 200$. At the close of the week, quite firm at $\$ 285$. But few trans. actions reported.
transactions in shares. *
Ophir-60 abares at $\$ 2,300$ per foot ; 68 at $\$ 2,200 ; 84$ at $\$ 2,100 ; 78$ a $2.000 ; 24$ at $\$ 2,200 ; 36$ at $\$ 2,100$ : and 60 at $\$ 2,100$
oould \& Curry-40 at $\$ 2,650 ; 16$ at $\$ 2,700 ; 20$ at $\$ 2,700$.
Chollar-20 at $\$ 365 ; 20$ at $\$ 360 ; 40$ at 365.
Savage-10 shares at $\$ 700$.
Potosi-10 shares at $\$ 96 ; 40$ at $\$ 100 ; 20$ at $\$ 110 ; 5$ at $\$ 130$.
Sierra Nevada-10 at $\$ 621 / 2 ; 10$ at $\$ 721 / 4 ; 15$ st $\$ 60 ; 35$ at $\$ 62 ; 5$ at $\$ 623$ 10 at $\$ 65$. Sanborn \& Co. report 174 at from $62 \frac{1}{6}$ to 65
Buruing Moscow- 10 at $\$ 50 ; 10$ at $\$ 61$. Sauborn \& Co. report 113 a rom 60 to $\$ 62 \frac{1}{2}$.
Mount Davidson- 350 shares changed lands at from $4 \%$ to 5 dollars.
Charles Caney-10 at \$20; 5 at $\$ 20 ; 40$ at $\$ 21$.
Meredith-105 shares are reported at from 20 to 22 dollars.
Wide West-L0 shares at $\$ 280 ; 9$ at $\$ 290$.
Rogers, F. D.- 10 ahrres at $\$ 17$.
Union-(Russ District,) 100 shares at $\$ 21 / 2$.
Burnsidem10 shares at $\$ 20$. Real del Monte- 5 shares at $\$ 18$.

* Quotations made at given rates per foot.

## Coso Stocks.

The Josephine has been but little enquired for the past wrek. It chang. d hands at the Stock Board from 10 to 13 dollars.—Holders asking $\$ 17$ to $\$ 20$ Coso-Not quoted, $\$ 25$ askod.

Whllow Springs-held at \$45. suld at $\$ 10$.

## Mexican Minea.

Mina Pricta finds no recent buyers, but is held at 8130.
Dive Padre is quoted at from 20 to 36 dollars..

## WASHOE STOCY REPORT,

[Compiled from the Daily Torritorial Eaterpribe.]
Adrices from the Virgidia City Stoak Market, since our last issue report but tittle busivess, paro from lack of sellers than buyers. Tho stimulue of fiction and pressure of boliduy demands bavo brought some good stock into the murket at fair rates. At latest accounts the market was very firm. Nearly all the Stucks of admilled value are advancing. The Enterprise aseerts its knowledgo there is " $\mu$ positive demand from capitalista for ground in twelve or fifteen companies $\mathfrak{j u}$ Virgivia district alone, but so carefully are operatious conducted that the stocks in request are scarcely suspected. In due tume the vesl of secrecy will be withdrawn, when the stocks so quietly dealt in, will, of course advance. We to not deem it advisubie to be more explicit at prescut."
The Ebterprise speaks as tollows of the effect of its pet Incorporation Scheme on the Stock Market :-
"Thus far, the effects of the Territorial Incorporation Act point to nothing like disaster. Contrary to the predictions of California croukors, orders from san fraucisen contanue to pour in upou our dealers, and coufdeace in the safety of investunent here is manifestly strengtheued by the Act. Honce the irresjastible inferenco, that the gloomy prophecies of certain par ties here, as well as in sun Franncisco, are simply a coucerted aystem of "boaring," of which advantage will be taken in due time. Timid holdera will do well to make a note of this fact."
Winter Fork.-The work of prospecting appears to be going on with ag much energy ha at any time duriog the Summer. Most compauies bave so well prepared for Winter, that a light anow atorm does not incouvenience them in their operations. Many developments are being made in varioue claims in this and Gold Hill districta, which cannot fasl to netruct the at eution of capitalists and induce iavestmeut.
What bids fair to prove an important discovery has been made just to the West of Guld Hill, by the Duan Company. The indications promise a rich sitver lead, and differ materiaily trom anything heretofore found in that district. Five dollars per foot is ollered for ground.
Il was reported on the 24 th ult. that a very fioe quality of ore had been atruck in the El Dorade, renembliug the Ophar, ete., but wo do not see any aurance in its quotations, $\$ 60$, with $\$ 70$ asked. It is claimed that the ledge is now 4t feet thick, with a paying vein of 12 feet.
There are also reports of rich gold bearing rock being struck to the north of Cedar Hill, at a locality through which it is thought the Ophir lead pass-
Tbe Utah company is also rejoicing over a new development, the character of which is not announced. It is quoted at $\$ 45-\mathrm{a}$ materjal acpanco. There is less dispusition manifested worchase claims in litigation than was apparent last Summer as a cousequence, Moscow is dealt in sparing. ly, while Marison, Geller and La Crusse are a drug in the market, they beug offered respectively at $\$ 25, \$ 8$, and $\$ 15$.
The Entorprise of the 24th ult. says that the Potosi could not then be purchased in Virginia City for loss than $\$ 100$. It was quoted at the San Francisco Stock Board on Wedneaday last at $\$ 110$, an advance of $\$ 20$ on previons quotations.
Norton stock remaius quiet ; wone offered in the market. Several tons of rock trom the mine in front of the Corapany's office, will compare favora bly with the best ore ever taken from Cedar Hill.
The Yellow Jackot Company are having rock from their mine arushod with fine results.
The Union Company, Gold Hill, are having a amall quantity of rock from their mine practically tested by crushing at a mill, which will tell sameching of its velue.
Ashland is offered for $\$ 10$ per foot, a small lot changed hands at these fig-
Ten feet Hazel Green bold at $\$ 450$ per foot.
Oriental is offered for 34 , without sule.
Nevada, which has been in demand for aometime at low figurer, is with-
out sale. The stock is offered at $\$ 6$ per foot.
Five dollars per foot is offered for North American.
Baltic is offered at $\$ 20$ per foot.
Ten feet in the Bloomingdale changed hands at $\$ 450$; Zouave is offered at $\$ 900$.
Birdsall ia quoted at $\$ 17$; La Crosse, $\$ 16$; Sacramento, $\$ 35$ to $\$ 40$; Baltic, $\$ 20$; Sierra Nevada, $\$ 80$; U. S. Tunnel, $\$ 0,000$ per share; Cedar Hill Tunnel, \$1.

## HUMIBOLDT STOCK.

Considerable Humboldt stock continues in market, but aside from the Mars, Cubs, Sheba, South Extension of the Sheba, and three or four other claims, there is little or no inquiry in that direction. There is almo a large quantity of Eagle and Silver Monntain district stock, but ontirely without buyers.

The following stocks, not enumerated above, are in the markat in Virginia City, and held at the Eigures annexed :-

| Santa Fi - - . . . $\$ 2500$ | Summit - - . . ${ }^{\text {S }} 000$ |
| :---: | :---: |
| Eropire . . . . . . . 500 | Washivgton Ledgs . . . 600 |
| McBee - . . . . . . 2500 | Milton - - . . . 2000 |
| Belvidere . . . . - - 1500 | Laboriag ...... 1500 |
| Peytona . . . . . 2500 | Sweezy ... . . . 2500 |
| Durgan . . . . . . . 450 | Caledonia . . . . . 800 |
| ElDorado . . . . . . 7000 | st. George . . . . . . 400 |

The Australian gold fields differ much in character from ours, being mostly in deep diggings, where the hydraulic hose and sluice cannot be used to advantage, or where at least they are not employed so extensively as in this State. They were very rich at first, and for a time they turned out a stream of gold more abundant than that which flowed from the claims of Califoraia.

GIFTS, DONATIONS AND SUBSCRIPTIONS
To the work entitled "The Metalic and Agricultural Wealte of tee Padific States." The publisher desires to thank the several gentlemen whose names are hereto appended, for their mrgnanimity and aid in behalf of this important work.

We would call the attention of our readers to the Stock Report which we give from week to week in the columns of the Press. This report is very full and, carefully made up from the most authentic sources, embracing all attaiuable transactions both in this city and in Washoe. Our report for this city, embraces a full statement of the sales at the Stock Board-each day's operations being presented in a tabular form. . We also re-produce the substance of the several Mining Circulars issued in this city. In order to give each weeks's transactions, full and complete, we have changed our publication day from Saturday to Monday. We istend to make each number of the Press a full epitome of the mining intelligence of the previous week, and add thereto such matters of general interest and information as shall be thought useful and advantageous to the miner, and the mechanic.

## Important Publicaiton.

We have been favored, by the publisher, with the title page and prospectus of the quarto work entitled, "The Metalic and Agricultural Wealth of the Pacific States.". The editor of this work has recently disposed of the "Mining and Scientific Press," with the view of devoting his entire attention to the publication of the work; to this end be is making arrangements for an early visit to the Atlantic States and Europe. The work if carried out according to the prospectus, will be one of the most valuadle publications yet presented to the pablic, and will prove of incalculable bene tit to California and the Pacific Coast generally, in bringing the immense mineral wealth of this region more prominently before the Capitalists of Europe. The object is a laudable one and ought to be encunraged. Mr. Silversmith is one of our oldest citizens and is well acquainted with the sub jects of which he treats. He desires but little aid and that we trust he will readily obtain. The following is the pros pectus:
prosfectus to the peopie of the state of ca
TERRITORIES.
The simbscriber, one of your earliest citizens of Califorma, and for the nal devoted to the chief resources of the Pacific States, resprectully submits the fullowing plan and propositiou for the purpose of brimging hithar from England, France and Germany the workiug classes, mechauise, artizans. miners, and metallurgists for the purpose of developing the resourets of nur
thiuly populated states and Territories, thereby reducing labor, the entablishng of factories, the occupatoon of the millions of acres of arable lanet now lying dormant, and to wort our mioes. The betefits accrining to ou,
Government-to marine couveyances-the merchant-the manufacturer, Government-io marine couveyances-the merchant-the manufacturer, provided the facilities are oftered to such emigrants, and according to the
tenor of our laws governing such. For these purposes the subscriber detenor of our laws governing such. For these purposes the subscriber de-
siree to seek only the necessary or pecuniary aid to take him across the Pacife and Atlantic, so that he may be eonbled to lay before the poople of Europe a work which he has compiled from authentic sourecs, comprising the
the mineral wealth of the Pacific States, includiog partly Mexico, Lower Califorbia, Britist Columbia, ete, together with a synopsis of the climatolo-
gy , agriculture, arts and manufaclures, with iuteresting statistics of gy, agriculture, arts and madufaclures, with iuteresting statistics of our
imports exports, and population. Also, the organie acts of our state, the
local and general laws governing mining, the Pre-egptiou Act, and kmilred locul and goneral laws governing mining, the Pre-enptiou Act, and kindred
subjects pe taining to the Pacific States. The au hor roservug for himself the right of trabslation of this work (whicl has cost him three years of his
time to collect and compile) in the German and French lauganges time to collect and compile) in the Griman and French langaages.
He enntemplates making the tour to the Atlantic States and Eurone in February or March, 1863, and will equip himself with the mineral materials, fossil remains, etc., and illustrate them by diagrams and discourses. throughout the Ablantic States and Europe.
Such a work which your petitioner has in
Such a work which your petitioner has in view cannot be published in
this State without an extraordinary outlay, nor bave we the mation this State without an extraordinary outlay, nor bave we the materiais, ar.
tists or skill in copperplate or wood engraving. The work will comprise tists or
from 400 to 500 pages, to be bandsomely intinstrated with colored phates, maps, etc., quarto form. The subscriber will add tbereto a complete list of all the associations and companies, especiully minngg companies.
He gues to Eurupe for the purpnse of seeiug all the manuraur He gues to Eurupe for the purpnse of seeiug all the manufacturing pla-
ces, machines aud utensils; also to the leading mining districts ces, machines aud utedsils; ; also to the leading mining districts end metal-
lurgical establishments, to acquire from the best sources there the best mirgical establishments, to acquire from the best sources there the best
mode of treating our rich minerals, and lay these several important feat. ures before our people through the Miving and Scientific Press, and the work he hereby offers. But the most important subject in his mission is
the inducements he will offer to Europenas of nur immensely rich mining the inducements he fill ofier to Europenas of nur immensely rich mining Gields and agricnitural lands, together with the great adyantuges offered by a liberal and protective government for industrious citizizns.
The subscriber, therefore, calls upon the cilizens in the Pacific States who this gravil but laudoble undertaking with means. Each subscriber will be furnished with a copy of this work, which is desggoed to be usefut iut the
tounting louse, to the profescional man and miner. The author desires to penple of this State he will refund after the publication of the work, or leave the amount to be taken out in books. Respectfully submitted

RECENT Patents-Granted to California Inventors through the Pacific. Patent Agency, Jo. Sulversmith Solicitor:
Herman Camp,-Patent for Quartz Crusher and AmalgaW. H. Riceardson-Putent granted for Washing MaEhine. Matteson, Nevada: Hydraulic Derrick. This invention has been illustrated in this journal, and has obtained great celebrity i hroughout the State.
Elander Heath, San Francisco, Spiral Spice, and 1P62, Vol. V., No. XIII.
G. F. Deerken, formerly of Nepada: Apparatus for separating Gold from Pyrites. This is one of the most useful inrentions of the day. Mr. Deetken has successlully worked sulphurets for a number of years in Nevada county, professes to have obtained greater results than others engaged in the same occupation. Mr. D has recently established himself in this Ccuuty, on the San Brino Road, year he Islais Creek, where lie has erected chemical and metallurgical works.

## THE EYES! THE FYES!! THE EYES!!!

## DR. E. H. PARDEE,

Ooulist and Aurist to the San Francisco Deaf, Dumb und Blind Asylum.

After a protracted blindness of more than five years. Dr PARDFE has made himself thoroughly and scientificall: acquainted with all diseases of the Eye, and is now practic ing with a success that cannot be surpassed in the Uniter States; and as proof of this he substantiates by many case now in California that have been cured by hin, after havin? exhausted the skill of the eninent physicians and oculists c New York city, Boston and Philadelphia.
From an extensive practical knowledge of more than 1 ears, Dr. Pardee asserts, and is prepared to prove, the there has been more blindness from bad and improper treal ment than from disease itsell-how can it be otherwise whe we take into consideration the effects of the old hacknie o-day and Bluestone to-morrow-more painful than deat and always more tedious than the disease. Patients an daily presenting themselves with chronic cases. and on $i$ quiring what had been formerly done, the almost invariab reply is, "I had my eyes burned with caustic or bluestone was bled and blistered, then cupped two or three thee in the morning-was ordered in a dark room-to keep $n$ eyes tightly bandaged-to avoid the open air and exercise with fifty other inconsistencies, the aggregate of which sure blindness. Patients should be careful and not pla their eyes at the mercies of a man who does nothing b burn them daily, not investigating the circumstances of ea particular case, but ignorantly and blindly adopting and f lowing theories the most erroneous, and destructive to $t$ eye. How much more rational and consislent to consult experienced Oculist, who thoroughly anderstands every d ease of this tender organ in all its aspects and varieties. PARDEE has from sixty to one hundred patients under daily supervision, and, with but very few cases, they have been treated by ather physicians hefore applying to him-a all to no benefit. Those wlo are doublifl are permitted call at Dr. Pardee's office and confer with the many patie who conveue there between the hours of 9 and 12 in forenoon. The Dr. has a large and only assortment of $A$ ficial Eyes on this coast juserted, having all the moveme of the real eye, and that they lor $k$ so life-like that no one tell them, when properly inserted, from the real eye. Th eyes are sold reasonable.

All the operations performed, such as "Strabismus," cross-eyes-" Cataracts"-or removal of the Lens by absc tion or extraction;-" Plerygium," or fleshy membranes gr: ing over the eyes. Artificial Pupils, \&c

# VOL. VI. S.IN FRRINOSCO, MONDAY, JANUARY 12. $1863 . \quad$ NO. 11. 

An Imprtazt Mani uy Clis Settlad.
A h ary mining caso which for the year past, has closell from work several of the moit importa $t$ mining operations in Giass Valley. has recently been amically settled withont recourse to the tedious and experisive proceses of law. The suit was brought hy the Mount Hope Company, of New York (ity. aguinst Chavanne \& C'u. of dirass Valleybeinge. we believe, a question of title. An injunction was laid upm the opeations of Chatame de ('u., "hich also harl the wfeet of closin: the eatensive upreations of Messers What if ('o., seadidn is ('0), aml others, therehy s.minaly depmesibs the general industrial pasuition of the thiving mining community in which these worke are lucated. We emmatulate all patios concerned in theirfortunate deliverume from an enbarrassme t more provoling than serions. We leam from the Niffinmel that the citizons of Graes Vallyy were quite julilimt over the happy termination of the matter, as well they might he.

## NEW PROCESS FOR WOREING QUARTZ.

We have seen the drawings of a new machi- e for extracting gold and other precius inetals from its matrix, which wa patented about two years nero, amd since which time the patentee has been diligently engraged in perfecting and reducing the same to practice. The machiue has be a put to prac ical work at one of the mills on C'ul. F'vemont's Mariposa es ate, where it has reduced quartz $f$ om seremal diflerent veins, with the most complete and uniform success gaining more than one hundred per cent over the best apparatus heretofure employed there, at ercy trial upon poor gualities of rock. The parenter is now in this city busily engaged in erecting one of his machines which will he reaty for operation in a short time. Due notice of its time of starting will be given and the public and all inte ested will be invited th examine the machme, and witness its working. No chemica's are empluyed in the proce.s. which is simple and cheap. The inventor is a gentlemen of hiph scientifie and practical a:tainments, and, from what we have seen and learned, we are inclin:d to the opinion that the invention will prore a most complete success. At the proper time we shall give a full illustrated description of the same.

Tine Eenness P'ass is reported iu fine condition for trav eling. Stations have been locatel at every three miles on the snow belt, and whenever a storm commences ox-teams are immediately sent out and the track kept constantly beat en down, Stages ran daily over this route.

Foos aresometimes so thick in I.ondon that the gas has to be lighted io the streets as well as houses. A year ago last winter they were thus lighted on several occasions, dur-
the entire day.

WHEEELR'S PATENT SEPARATOR.
A represents a cup on the top of a hollow shaft for the admision of water.
$B$ i the driving and luose pulley.
$\mathrm{C}^{\prime}$ is the horizontal driving shaft.

L. is a pipe and cuck for introlucing water throngh the hollow shaft $F$, and the arms $\mathbf{C} G \in G$ into the pulp for the

Gov ruor Stanfort on Tazing the Mines.
Grov. Stanfurt, in his late Message, makes the following practical and selusi le romarks on the entiject of the propused laxat on of the mines:-
The racstion of twing mining clains by the fieneral twoumment, after a ong slumber, se wis to be arain revired. The agitation of this su ject I cannot but regard as extrem ly impolitic. In a rast majurity of claims it is impussilile tor extimate their value above what thay may afford to the labores. from day "o diy. and with most of the balance th re can be no a certained 1 ermanem. cy or reliableness of valu - upun which all assessmen could be male with cunfidence or with satisfaction. A tix mpon these clains can never he had that would be ju till its burde s or equituble in its results. When the salacity and toil, tha anxirty amd patience, of the miner are rewarled will success the results of that s ccess, become the subject of taxation ami the sutuce of reve ne. 'There can be question that the perpie of the Coited States have reaped : greater harvest. of riches from our mines, under the libe al policy of rise Go ernment hithert') pursued, thais they wo uhd have donehad the discovery of our mineral wealth been immediately followed by Federal burdens, which mut of necessity, have been unergually imposel. It is a woll known fact, that the yield of our mines finds an alnost inmediate distribution among our people, a fact that tends as much to strengthen the Gevcrmment as though that yield went directly to bel coffers. It is also well known, that while their rearly product is now equal to what it erer wa, and while other interests and other communities are, throgels this influence, inerasing rapidly in wealth, the mising communities do not adrance-in fact, it is a question if they do not retrograde. year by year.
Is it wrll, then, to place any discoumpoment upon an ininterest of such vast importance? Shond it not rath $r$ be carefully fostered and $\mathbf{j}$ diciously enconroged
Improvements above a certain amount upon mining claims, might, very justly, be made the sulject of taxation with every other species of property which is created ly wealh, ind stry, or skill; but if the General Government shall determine to change her policy as to oir mines, and must have rerenue direct from them it were better to dispose of the lands upon which they are found, in small quantities, having: a just reard to the acquired interests existmg under the past policy of the Government rrlutive to them. I can see no good reason why the Governm at should retain to her use mineral lauds more than agricultural lands for both must heequally developed by the industry of indli itmals, and both, without that industry, would be valueless to a natien.

*     *         * Thes bject is one of impurtanes, hat I cannot here duscuss it to the extent which it deserves. It is a good $r_{1}$ le, however, "to let well enongh alone," a d is seldom departed from with advantagre.

## MINING NOTABILIA.

Esmeralda Mines-Great activity appears to be manifested in working some ot the principal mines in Esmeralda The Wide West, and Pride of Utah are especially mentioned. We see it stated that still another lot of rery rich ore from the former mine is about to be shipped to this city to be worked, which it is confidently expected will yield $\$ 100$ to the ton! Already four hundred tons of rock are oat, and this, with the amount to be taken out duriug the winter, will keep four mills constantly at work till spring. A late vamber of the Star gives a lengthy description of a new quartz mill recently constructed at Aurora by John $\dot{\mathrm{D}}$. Winters. which will cost in the neighborhood of $\$ 90,000$.

Ilumbondt.-Extraragant reports are current of a nen Silver mine recently discorered near Fort Clumehill, and known as the Blue Iea 1. The mine is owned by a company of Germans. and is said to prodnce ore far superior to anything erer found in the Ophir or Mexican mine. Assayers and other competent judges of ores have declared this to be a fact-so it is said. It is more than probable that the country may produce a rein as rich, or even richer than the Ophir; and it is not at all inprobable that the industrious Teutons aforesaid may bave stumbled upou it.

A correspoudent of the Marysville Appeal says that of the 6,000 claims th.t are recorded in this Distr"ct, the Wide West, Anteope, Pride of Utah, and Esmeralda take the lead-not because they produce better payiug ore, but that many ot er mines which prospect well and show• well defined ledges have no moneyed managers, and have to wait till some men of means and business capacitytake hold of those rieh but neglected silrer deposits.

Great complaint is made of a lack of suitable machi ery in that district, and the writer above alluded to thinks any persou will do well who will introduce some improvement in that particular.

The Pride of the Aatelope. Gpn. Jackson and Mount Broley are tur.ing out rich ore. They were located some two jears ago, but had to keep the native silver till touched by the magic hands of San Francisco speculators. The Wide West mill will be completed in about a month, nnd thus afford a better oppurtunity to those who cannot bear the expense of seuding th ir rock to San Francisco for assay, to test the quality of their respective ledges.
The Territorial Enterprise learns from a gentleman direct from the Fumboldt, that a rery rich $s$ lver ledge was discovered about a month since iu the Buena Tista District, the croppings from which assay $\$ 1,600-1$ t is called the Sargent ledge.

The Monitor, another new discovery is said to be proving :itself exceedinglyrich. Business in Mumboldt is slacking up considerably since Tinter set in. John O. Fail's mill at Buena Tista was tu hare gone into operation a week ago -Saturday on some choice rock from the Mars and Mational :leads.

Tirgisla City. A recent run of the Central Mill in Tir gina City produced one thousand pounds of bullion. Each - ounce of this bullion is worth $\$ 250$, or $\$ 7.500$ for the run - of twen'r-four hours. 'Thissesult was obtained from Gould \& Curry ore.

A thorough test of the Whitman coal is now being made -at Satro's mill at Day on. Cons derable improvements are also going ou there for the health and accommodotion of the hands.
A. Wise Precattion:-Mr. Almarin B. Paul has taken the precantion to put in a large flume near his big mill. some four or fire feet in width. by tro and a half or three feet in height, and placed in such a position as to eary all the water of the ravine around the mill. All who were in the Torritory last Winter will adnit the risdom of this precaution. There are other places along the canon, says the Enterprïse, where flumes should be built, otherwise, property may be damaged.

Tife Blochade.-Up to the first of December 540 ressels, endearoring to run the blockades, had been captured by the Federal cruisers. Their cargoes alone are valued at $\$ 40$,coo,000.

Gons.-The number of Revolutionary Soldiers on the ion list, Jamuary 30th, 1862, was only 30.

Oxe Year'a Treasure Exports.-The shipments of treasure from San Francizco, during the year just closed, were as follows:
To New Tork
"a Englaud.
"
$\$ 26,194,03493$
12,950,139 61
2,660,755 29 17.91600
" Japar.
Manilla. 65,651 64 12110 62.41400 $434,507 \quad 79$
$3000 \quad 00$ 3,00000
10,00000 10,000
00 188,221 71
$\$ 42,561,761 \quad 07$
Academi of Natiral Sciexces.-The following named gentlemen have been elected officers of the California Academy of Natural Sciences for the ensuing year: President, Colonel Leander Ransom ; First Tice President, Dr. J. N. Eckel; Second Vice President, Dr. J. B. Trask; Corresponding Secretary, Dr. W'm. O. Ayers; Recording Secretary, Professor W. H. Brewer ; Treasure, William Heffley ; Librarian, Professor T. D. Whitney. Curators-On Mineralogy, Gideon F. Moore ; on Botany, Dr. A. Kellogg ; on Paleontology, M.S bb : on Concholugy, Dr. J. S. Cooper ; on Entinulo: y, Dr. If. Behr.
More Copprr - The Calaveras C'lirunicle. says that a new lead of copper has recently been struck near Campo Seco, on ground belonging to Mr. Cbamberlain. Many rich veins of copper are already known th exist, several of which are now being worked in the vicinity of this discovery, and expectations are collfident that the raising and shipping of copper ore will soon render Campo Seco ole of the most flourishing mining camps in that region.
Another.-A new Copper mine has recently been struck dear Hog Hill, about four miles from Copperopolis. It was discorered by Capt. Nulty \& Co. It is a rich rein of sulphuret of copper and, it is said, the lucky finders have refused $\$ 150,000$ fur their discovery.
Copper Sifock.-One share in the Consolidated Copper Mining Co. was sold yesterday fur $\$ 100$. The company was organiz ed some two weeks ago, consisting of thirty shares, each representing $10 n$ feet on the ledge, and the stockh.lders were at no other expense except to stake out and record the claims. The stock may therefore be said to have advanced from nothing to $\$ 100 \mathrm{u}$ slare. [Aerala Democrat, Jcn2. $3 d$.

Tife Acton Copper Mine.- This mine, to which we aluded last week, has made its October report, which shows an arerage jield of 15 per cent.-a gain of 3 per cent. on its previous average. It is located in Canada aboot 50 miles from Montreal, and has recently been purchased by a Comspany of Boston capitalists. The ore is shipped to Boston via Portland, for working. The yield for October was 388 tons of copper. About 250 men are emplojed at the mine.
Tife Ulistere (N. T.) Lead Mine, recently discovered, had been opened, at last acconnts, only ten feet deep; yet it is thought by experienced miners that the developments already made are such as to marrant the couclusion that it will prove the most extensive and raluable lead mine in the world. The ore is of fine qualitr, and the facilities for working the mine and transporting the mineral to a market are rery superior.
Coal in Vrctoria.-A wealthy English Company has sent out an experienced mining and civil engineer to ex plore the island for coal. Should it be found of proper quality and quantity, the Company will immediately inrest a large amount of capital in the enterprise. The engine.rhas alleady arrived at Victoria.

Another Anxiety--British capitalists express greatanxiety in consequence of the rapid drain of specie from England to India. The pasm nits for Indian cotton are becunins rery heary, the last steamer for Bombay having taken out about $\$ 5,000,000$-the largest anount ever dispatched to one port, although an equal sum has been sent befure to the East in a single ressel for distribution among several mar-

Subscribe. - Are you a miner and not a subzeriber to the Minting axd Scientinic Pres? If so, you are an annual loser of mauy times the price of a year's sulbeription, particululy if you are engaged in quartz mining. The same amount of practical information, important to miners and mechanics, which is contained in a volume of the Press, cannot be bouglit from the shelres of any boukstore in the country for the price of several year's subscription. Do you ever send a paper to the "Old Folks at Home?" If so and you desire to send important information and raluable reading matter, you can find no pap $r$ that will be read with so much eagerness by them, or one that will conrey to them so full an account of the real industry of the country as the Mining and Scientific Preses. We invite all to send us their names aud four ctollars, or two dollar: fur six months, and become patrons of the only misisg p: per printed on the Pa cific coast. Those who receive a raper with this paragraph marked may understand that it is spnt to them for examimation, and with the hope that it may so for meet with their approval as to $w$ rrant their subscribing for it at once. It is not, our usual castom to receise a enbecriber for less than six months; but inasmuch as we are ansious to introduce the paper where it is not now known, we will, for the present, send the Press for three months even, on the rece'pt of one dullar, in coin or stamps. It is vur helief that no one will wish to discontne the paper after being a constant reader of it for even that short perion.

Coral al mie Farallones.-Coral was discovered a few days since on the Farallones, by a party connected with the Coast Survey. The color is red, and the branches are rather coarse in form and size. It was in the progress of formation. for the coral animals inside were still alive. Sive coral. it is said is not found so far north in any other part of the world by several hundred miles. Similar coral has been found in Mouterey Bay.

Novef. Invention.-A Felderal army officer has invented a nethod of disabling artillery when it becomes necessary to abandon it to the eneny, which is said to be most effectual, and most entirely surerzedes the present method of "spiking." Any effort on the part of the enemy to remove the disabled instrument will instantly burst the gun, and scatter destruction among all who may be tear at the time. such an invention must give the party holding it quite an advantage over his upponent, so long as the secret is liept within the knowledge of ore party only.

Land Monitors.-Mr. Redstone of Indianapolis proposes to build for Govermment nine "Land Monitors," or engines of war, to cost $\$ 900$ a piece, to weigh 1,800 pounds each, 25 horse engine, and all, with coal, water, ammunition, knives, d.c., iucluled in the above weight. Each to be handled by two men; to discharge from each 10,000 shots in half an hour ; to be capable of rumning 20 miles an hour over any grade less than 45 degrees; to be perfectly managealile in turuing, climbing or descending; to clear more obstructions from artillery roads than 500 men; to reap the rebels clear ly divisions; to resist canister, grape, and small shot.
Ratlioads in the South.-The want of machine shops to replace rolling stock along the Sonthern railroads as fast as it is woun out and disabled is beginning to be serious'y felt. The tracks are kept in repair by the rails which have been taken up along the horder and carried South. What few repair shops they have are kept constantly at work and mechanics in this branch of business are highly prized. If the war continues much longer a majority of the Sou bern railroads must stop running entirely.

We would call the attention of our readers to the Stock Report which we gire from week to week in the columns of the $P$ ress. This report is very full and carefully made up from the most authentic sourc s. embracing all attainable transactions both in this city and in Wrashoe. Our report, for this city, embraces a fall statement of the sales at the Stock Board-each day's operations being presented in a tabular form. We also re-prodnce the substance of the several Mining Circulars isened in this city. In order to give each weeks's transactions, full and complete, re have clianged our publication day from Saturday to Monday We istond to make each number of the Press a full epitome of the mining intelligence of the previous week, and udd thereto such matt rs of general interest and information as shall be thought useful and advantageous to the miner, and the mechanic.

Siare Novalas s. XI. Cu.-The annual meeting or the elec tin: of Trusters will be hed at office $\mathbb{N} \jmath .40$, Montgumery Suret. Jun. 12th.
Lacmpe Mining fo--The Anmal Meeting for the election of Trustees will be leeld at Ollice 11t, Battery St., Jin 12th.
(Contral Silver Mining Co.-The Anmal Mreting for the der tion of 'Trmoters will be held Jan. 13, at Oinice, No. 71? Monlzomery street.
 hinlam's will be sell at auction for usseg sments, at No. 400 Montromery steet, ou $J_{i n} 27$.
Dhsurt Mining Co.-Shares of Jelinguent stockholders will hesuld at anction, for assessn'uts, at Nu. 400, Munt gomery street, Jun. 27
Wide West Mining Co.-The Fecretary of this Company publishes an important notice to Stackhulders, in the daily propers.
Rwore River Mining Co. - Ren cents per share has been hevied upon the capital Stsck of this Cumpany, payable Jan. $1+$ th.

San Francisen S. M. Co. have laid an assessment of $\$ 25$ per share, a ayable on or before Jan. 1st, 1863.
Parific (Quicksilver Mining Co.-Assessment No 3, of \$1 per share was levied, Dec. 22, payible immediately.
Keyst ne Copper Mining Co, advertise for preposals to purchase or treat $3 d$ quality copper ore. Proposals received till fan. 15th.

Mammoth Ledge Mining Co. givo notice of an assessment levied and payable on or before Jan. 13th. Also that the first annual lleeting for the election of Trustees will be beld at office, Jan. 1 Tth

Hale \& Norcross s. M. Co have levied an assessment
of sioper share payable on or befure Jan. 26th.
Charifa Cliny Mining Con-An assesment of $\$ 150$ per shure was levied on the stock of this comnany. Bee. 14ths 1852 , payalle ou or before January 14th, 1863, at office, 338 Montg'omery St.

Live, Oak Copper Mining Co.- Office, Montgomery Block - An assessnimut of thi ty cents per share was levied, Dec 1st, 1862 , payable in thirty days.
Nortit Potost Shivel Mining Co.-An assessment of four dollars per share was levied on this Company, Dec. 11 1862, pa able on or before January 16 th, 1863, at oflice Cor, Battery \& Washi gton Sts.
Meredifi Goid \& Sulver Mining Co.-An assessment of two aml a half dollars per share (five doilars per fo $t$ ) was levied by his Compiny. Dec. 11th, payable immediately, at office, 712 Montgomery St.

Buthon G. \& S. M. Co.- The Stockholders are notified
that they will heur something to theeir adrantage by cal ing at the office of the Company, cor. Piue and Muingomery ls.
Sumtos (3. \& S. M. Co, -An as essment of two dollars per slare was linied Nuv. 25. payalle on or before Ihee. $30 . \mathrm{h}$, 18tiz, at oflice S22 Montganery Ait.
 lars pur : hate was leviei, Nov. 29th, [ayable on or b. fore Jan. 1st, 1863 , at offiee 502 Mor fganciy St.

Jimset (f. \& S. M. Co.-An aspesment of twenty-fire econts per share was levied, Nov., 21 st and is nuw due, aod Mayalh at uftice 320 Clay sit.
Fibmad (i. d. N M. (on.-An asspsement of 25 cents per share was levied, Xor: 2lst, and is now due at office 326 Clayst.
lownis (i. if N, M. Cor-An as essent of 25 cents per share wns levided, Nov. 21st, and is now due at clice No. 320 ( lay = t.

Fil Jonamin fiss. M. ('o.-An as essment of one dul-I-r pre share was levied, Wec. 1st, and payable at office, on N. E. cor. of ('a ifumia and Montgome y ste., or to simperinterncont il Vi ginia ("ity.
Another asecsment of the dullar per share was levied Dec. 2!. payahte as above.
lowi Mixisg ('o.-An assessment of Four Dollars per Share was levied, Dec. 4th. payable at office $52 \%$ Montgonery St. an, or before dan. 3d, 1863.
Josephine Mrara Co.--An assessment af tyodollars per share was levied, Nov. 19th, and is now due and pajable at office No. 21 Stephenson House.
 share was levied, Nov. 17 th , payable with ${ }^{\circ} \mathrm{n} 30 \mathrm{day}^{\prime}$, at uffie 个12 Montermery St.
Pliwhey Mininc: C'O.-An assessment of 50 cents per slare was levied, Nov. 15th, payable at once, at office 204 Frunt st.
Ambrican Qutheshefer Mining Co.-Au assessment of one dullar pur share was levied, Dec. $16 t h$, payable at Com1rany's Office, in J'etaluma, within 30 days-At the expiration of wl ich time delinguent stock will be sold.
Napoleon Coppler Mining Co.-The first a nual meeting of this ('ompany will he held at office $N$ '. F. corner of Sacramento and Montromery is s., on Monday, Jauary 12 th 1863, at 8 I'. M.

Burning Mriacow S. M. Co.-An assessment of Two Dolars , er thare was levied, Nc.v. 25, for the purposc of detraying expenses of steam pump and machinery now being arected to drain the mine. Prompt payme $t$ is requesten at the Company's ollice, cornen: of Mon gomery and Sackson Sis., to Jus. L’. Nuurse, Sec.

## WASHOE MINING NOTICES.

Baltic Mining Co-Notice is given of an adjoumed sale oflares in this Company, to take place on the ground, Jan. 31 st.
Progress G. \& S. M! Co.-An assessment of 20 cents per foot was levied, 1)ec. 27, 1862, payable furthwith
Sreesy (O. - TVashington Ledge. - An assessment 210,000 being 5 . 1.2 per foot-was levied on the stock this Comyany, Dec. 28, payable at the Secretary's Office. Medan Building
Miners' Mreting.-At a meeting of the shameholders of the Sipgel Mining Company, it was resolved that a meeting be called of all the miners of the Siegel Mining District, for the purpose of making laws ly which said Districe. may be governed, and that said meeting shall take place on the $15 t h$ day of January, 1862, in said Siegel District, in or near a certain place better designated as the Siegel Min ig Company's Cubin.
Caution.-D. M. Tyrell warns persons agaiust purchasing certain 10 feet of ground in the Wellington Co., standing in the name of J. B. Magee - also 20 feet, standing in name of W. Williams. (See 'Territorial Inte prise.)
Ashland Co-TI. A. Gould, in the name of the Moss Co. notifies the Ashland Co. that their westerly drift has cut the Lamb ledge, in the MossiCu.'s sround, from which the Ashla d Co. is furbidden to extract any valuable inetals.
Eldorado (f. \& s. M, Co.-An assessment of one dollar per share was levied, Ded. 31, 1862, payable, Jen. 22. 1863, to the Secre ary, at corner of Montgomery and California streets, or to the Superintendent at Virginia City,
La-Plata Oro Co.-Gold Hill District.-An assessment of two dullars per share was levied, Dee. 26, payable at once, at Office of the Sceretary, Court-house Building, Virginia City.
'T'exas Co.-Tennessee Ledge.-An assessment of 25 ets. per foot was levied, Dec. 22, payable ou or before Jan. 21 , 1863.

The Regular meeeting of the Company for election of officers. will be held at the Comet Saloon, Virginia City, on Saturday, Jan. 21
The North American Co., Gold Hill, will sell at auction,

Jin. 31, stock of sharcholders delingneut in payment of vesuments.
Grass Valley Co.-A meeting of this Co. will be held
the "Medun," is Virginia ('ity, on Thureday. Jan. 15.
Arhland G. ©.S. M. CU-An aseresme int of filly ceits per share was levind, 1he. 10, payable at the Gflice of M. J. l'ower, Sec., B. St.
Nubman siluer Minino Co.-An aseesement of One Dollar per share was levied, Nov. 19th. payahle an or before Dré 31st, to the Simemintendent in Yiminia ('ity, or at the ullice, No. fo, Montumery Etree, fan Francisco.
Dlaktio Ginte Mining Company, - An assesament of ten
 chice on C'Strect, Virginia City,
 Company have wrorgfily claimed and wolked their ground sitere July, 18c0.
I'riman fi. \& s. M. Co--An aseesment of Five Dollars ier the re was levod, Nov. פth, and motlar of 'Ten Hollas per =hare. Nus. 21, [ajable at cnce to the Eccoctary, R. J. Mi:chel.

Comedmia Tinarl asid Mining C'o.-An asecsement of Thirty-two Dollars per share was levied. Pec. Eth, Iagable immediately to the sicreary, Mantin White.

The Cumamy Rork ('o.. lymg nixt Wrat of the Tirginia Co claims have notified the Hazel Green, Tingley and If ach d. Paxton Companys that thry are tresepereing upol the Chimney Rock Co's grumud.
Li Chosee Mining Co-An a seesment of $\$ 125$ yer chare was levied, Dec. हth. I ayalle at cffece 73 C st ett, Virginia City
Hawk Iiye Gif,ter Minivg Co-An aescement of 25 cents per foot was lenicd. Iec. Gith, 1 agalle in.modiately to S. A. Krllogg. Sec. Guld Ihit'

Monecan Co, Cedar llill.-Anasecssmint of fifty centsper fout was levied. Iec. Eth, pajable forthwith, to the Eecretary at Virgiuia City.

Oriextal G. \& S. M. Co - The id asecsement off 15 cents per foot, was lev cil, Lec. 8th, and is 1 ayable at cffice, No. 31, C Street, Virginia City.

## ESMERALDA MINING NOTICES.

Tue 7exobu Lode Ccmpany, gire notice that hey claim a supmior title to the Johnson Co. cluming the same pry und, so far' as said localities couflict. 'I his grous is at Irtion of that now held by th:e Comrany kngun as the Wide. West Company. The notice is signd liy A. W addell, J. ('. Dorsey. \& P. Dors y and Jame Fiher.

## COPPER MIINING.

In an article under the abore head in our last issue, we stated that coper ores of less value than 20 per cent. were rogarded, in this market, as umprofitabie for shipment. We have since learned from ratios largely interestrd in copper mining, that contracts are now leing made for shipment of as low a grade as 12 per cent. One contract involving the delivery of sereral thonsand tous has recently been made in this city by the Napoleon Copper Miving Co.-based upon that per centage and upwards. According to the reports of competent judges, whose opinion are founded upon reliable assays, the general average of the unassayed ore, as it comes from the principal mines of Calareras, will excced the figure named ; rery little, if any being taken nut which falls below 8 , instead of 5 per cent. as we stated last week.

The oninion gencrally obtains that all below 20 per cent. is valueless in this market, and we had intended to show in the present issue, by reliable data, that such conld not be the fact The information furnished us, as above, reuder's such an exposition unnecossary, and we can now assure miners that they can obtain favorable advances in this city on ore rating as low as 12 per cent.

The contract of the Napoleon Co., of Calaveras County. is for a term of three years, the contractor, a large cap talist of New York, taking all ore from 12 per cent. upwards. The delivery is made at the ships tackle in this city, payable in gold cois, and the assay is to be made here. Shipping merchants 'here, amxious for returu fieights to New York, :are willing to advance say 50 per cent. on 15 per cent. ore, basing the price in the specie value in New York or Boston. The currency value is $\$ 5$ i5 to $\$ 6$, to the one per cent - of the assay which, on 15 per cent ore, is from $\$ 86$ to $\$ 90$ per ton. It is understood that these same parties have written to their correspondents East, for farther advices, a d that, in a short time they hope to be alile 10 advance on all ore assaying 10 per cent. and upwards. Our readers will recollect that Comrency now ates 35 pr reent less than Specie.

Joston, New York, and Swansea (Wales) are nuw competing for our ore. Baltimore will soon make a fourth bidder.

To show the profi able chara ter of copper mining we again refer to the Napoleon Company :-
Cost of taking ont one ton of 22 per cent ore... .$\$ 300$ .Sacking, teaming, freight, drayage, etc .1200 $\overline{\$ 15} 00$

## Sale of one ton of ore in San Fran. for gold \$66 00

 Net profit.85100
Again, the company above named hare been in operation only seventy duys; yet they hare erected stemm works, macline shops, houses for miners, superintendents' offices, etc. and all without lerying any assessment. The ore sold having paid all expenses, with the prospect of an early dividend.

According to present indications, copper reins are quite . Rs generally diffused throughout the momutains of California
as g ld bearing reins, and whereser found, the former are far more profitable and reliable than the latter.
When the sp cial attention of cap talists was first. directed to the Copper mines of Cornwall and Devon, it was the opinion of scieutific men and all those who examined into the matter, that the " lodes" as they werc called. existed only to a limited extent both in territury and numbers. Indeed it was not until the commencement of the present century that the contrary opinion began to prevail, and up to 182.5 only 188 companies were engaged in this business. This number had increased in 1855 ( 30 years afterward) to 633. This result, it should be remembered, is confined almost exclusively to a territory not much larger than the sinale County of Calareras and the yield from which, in enpper alone, exceeds at the present time over $\$ 5,000,000$ in value, anuually-and that too, derived from a class of ore that rates at the very low grad of ouly 614 per cent!
All knowu facts go to show that the copper mines of California are quite as reliable in thrie depth and extent as those of England. In the latter country numbers of copper mines are n w frorked to a deptlo of from 1,000 to $1, \overline{5} 00$ feet. and some have been traced, in their I near extent, five or six miles. The heaviest class of steam encines are em ployed in draining some of these mines. In the "Consolidated Mines," for example. thr e engines are employed for that sole purpose, the largest of which has a cylinder of 90 iuch s, inside diameter, with a troke of 9 feet 11 inches. It is rated at 310 -horse power. This mine alone, from 1815 to 1856 sielded conper to the value of nearly $\$ 15,000,000$.
From the above data, it will not require any very great stretch of the imagiation to place the value of the copper interest of California. within the next decade. nearly upon a par with that of gold at the preseut time. Within one year we shall probably be prepared to smelt our own ores and thius rastly increase the value to the state of a given sichld of re over that realizel? at present Smelting works will no doubt be erected, at convenient points for the delivery of ore and procurement of coal, as fust as the mines are dereloped. Statistics show that even with the large increase anticipated, there need be no fear that the supply will exceed the demand to a degree $\kappa$ hich will materially atfect the price. The consumption of copper is rapidly increasing, and the production has never yet been ergal to the demand. Eng luad, notwithstanding the constant and rapidly increasing yield of omr mines, is a large buyer. Her imports for 1851 were, in round numbers, 48,000 tons; in 1858 , the latest date we have at hand, they we e 66,000 -an increase of about tio per cent. in fonr years. Copper may henceforth be set down as one of the staple productions of C'aliforuia.

## MR. LATHAM' MINING BILL.

The Washington correspondent of the Alt $l_{\text {writes as }}$ follows in reference to the Mining Bill recently introduced into the Senate by Mr. Latham:
"The bill of Senator Lathrm, for the development of the mineral resonrces of Catifornia and the Terri opies, directs the Commissioner of the Land Office to continne his investigations in relation to mineral wealth of the country, by means of surveys, etc., and authorizes explorations. practical and scientfic experiments, the collection of specimens, new improrements iu assaying metals, experimental test of value, etc.
If the Commissioner is not more successful in collecting reliable data in the future, than, judging from his late r port, he has been in the past, the country will derive very little benefit from his "i ivestigations."

Quartz Reduction in Sin Fraypisco-The Pacific Metallurgical Works, in this city, dur ng the past week, have reducedtwo tons of ore from the claims of the Sacramento Company, ${ }^{n}$ Cedar Hill, Virginia City, the product of which was $\$ 1,11365$ in gold, and $\$ 405$ 个 is silver.

They also reduced two tons of rock from the Wide West lead. Esme alda, from which they took $\$ 1,900$ in gold and silver.

Parties interested in Washoe will find some pieces of rock, at the office of the Jewel Gold and Silver Mining Co, No. 612, Merch int street, which are worth looking at, and which the Secretary, Mr. Armstrong, will take lleasure iu

## Report of the Land Commissioner on the California Mines.

The report of the Land Commissioner to the Secretary of the Interior, so far as ic relates to the mosing interest of this Const, betrays a lamentable lack of iuformation in an Officer of the Government, whose duty it is to collect valuab'e information for his particular bureau, upon which Congress is expected to base legislative action. The Comin ssioner indulges in a class of estimates with regard to the mines, most extravagant, and solnuse as to be almost utterly without foundation; and upon such fancies praceeds to demonstrate that an inmense revente may be derived tberefromin aid of the National Treasury "This year," he says, they should yield $\$ 10,000,000$." After assuming that the mational debt, on the lst of July next will b: $\$ 788,000,000$, the Commissioner says :-

A tax of some 8 per ceut. on the whole yield of the mines would upon the maturity of a proper mining system, and when the same shall erentually go into full operation, pay off this interest. enable the fiovernment to reluce by at least two thirds the existing direct tax, and from the residue and imposts have an annual income sufficient to support the Government and provide a fund for the gradual extinction of the public debt ant restore the currency to a metalic basis."

The above estimates are based upon the supposition that the mines of the Pacific Coast will yield $\$ 100,000,000$ the present jear and that that sum will $s$ on increase $t$, three and fore times that amount! "The product of Salm n River Mines," he says "has been estimated at, $\$ 20,000,000$ for the present year"!!
Such ostimates, outside of the Secretary's otherwise valuable report, could scarcely be found in any other documents than those of the purest Munchausen school.

Anuther notable example of the mexcusable looseness of the Consmissioner's assumptions and estimates may be found in the following quotations from his Report:-
The nsual size of a quartz claim in the mining region is 100 feet on the line of the lode or rein, and 100 feet on ench side, equal to an area of 20,000 square feet: or, say, 1.200 chaims to the square mile. Alluw $t$ 'at obly one-bundredth part of the monntain surface is occupied by paying leads or veins, there will be space for $3,600,000$. But dovernor Erans of Colorado estimates the already discovered gold bearing recion in that. Terr tury as affording ample room fur $8,000,000$ claims, and states that new discove ies are daily increasing this area.
A glance at the map is sufficient to show that the mineral region of Colorado occupies less than one-sixth of the whole extent under consideration ; but assume it to be oneixth, there will be ample extent on this basis for 4.800 .000 clams. which, if worised, would give employment to 20.000,000 of men. Quartz that yields $\$ 12$ per ton will pay in farorable localities *** Some of the recent discoreries are estimated as high as $\$ 20,000$ per ton, but these have not yet been worked.
It seems scarcely possilile that such estimates and assumptions, as we have qquoted above could find their way into so grave a document as the Report of a leading Department of State. We must certainly suppose that the Honorible Commissioner could never have obtained his information from any member of the California Delegation in Congress. From our personyl knowledge of the watchfulness aud intelligence of our energetic mining member, Mr. Sargent, we feel quite confident that this report will he so theroughly "ventilated" on the flon of the House, that the members and their constituency will promptly abandon all hope (should any have bean engendered by the Commissioner's flourish over our fabulons wealth) of any suck relief from ge eral taxation, as is shadowed forth in the remarkable document under consideration.

The Commissioner gravely and anqualifiedly assumes that the yield of the current year will reach $\$ 100,000,000$. In another colum we have given an accurate report of the shipments of treasure for the year ending Jan. 1st, 1863, which foots up, all told, only $\$ 42,561,761$. This shipment, it should be recollected. has been made under the urinsual stimulus of an extraordinary demaud for gold at the East, and the existing apprehensions of serious business derangements, which have had a $t$ ndency to remove much timid capital, for foreign investment. 7 hare is not one particle of evidence which would lead to the probability of a single dollars increase of next year's sh pments, from this
cept the possible additional yield of one and perhaps ,wo million from Nevada Territory. The Secretarys estimate
for this year will be much too large if divided by two:
The estimate of $\$ 20.010,000$ for the "distant 'Territory of Washingtot" can ouly exci e a smile at the Hon. Seceetary's credulity. We hope for the credit of that official's julgment, the printer has accidentally affixed one cypher tou many-for $\$ 2,000,000$ will come very near the correct figure, for the yield of that tervitory.
The Commissioner's ideas with regard to the number and extent of the quartz mines, are even more extraordinary, than these in relation to the general yield of all the mines. Were we to give him fully ten years more in which to continue the development of the mines, it would even then be necessary to divide hisestimate biy as high a umbler as 12 or 15 to arrive at anything like the correct figures! The Commissioter procceds upon the assumption that "one-hundreth part of the mountain surface [of California] is occupied by paying leads or teins [of gold-hearing quartz.] Let us fiyure a little. "The mountuin region of the sitate" covers about 160,000 square miles. One-hundredth part of which is 1,650 equare miles. Now we presume no Californian, well posted in such information, would estimate the lincar extent of all the paying quartz veins of the State higher than 450 miles. Alluwing 100 tert in width to the claims, they would all occupy a space of only if square miles-or less than one twenty-first part of the estimate of the Commissioner.

The luyal citizens of California are perfectly willing to pay their full proportion of the taxes necessary to carry on the Government and the war. but they most earnestly protest against any extravagant estimate of the value or yield of our mines, for the mere purpose of fixing upon as an excessive rate of taxation, which can only result in retarding the de. velopment of our mineral wealth, and, to that extent, in cutting off the Government from that resource upon which, above all others, we norr rely to carry us through the commercial crisis necessarily consequent upon such a gigantic struggle as that in which we are now engaged.
No one at all acquainted with the mining interests of California would for a moment think it possible to collect a direct tax of eight per cent. upon the gross products of the mines. Such a collection, if it could be enforced at all, to any extent, would have the effect to decrease the yield of the mires at least 30 per cent., and put an almost complete stop to their further development. Not one half the mines of California, either placer or quartz, yield eight per cent. profit over the lowest rate of wages. Mining, in California taken collectively is the poorest paid labor in the State. The arerage returns for each day's mining Jabor performed in the State is less than $\$ 2$, on which a tar of eight per cent, at the enst of living would be absolutely ruinous. Fully one half of the mines would be abandoned, rather than pay the tax. Of course there are a few very rich mines, in nearly every locality, which are gielding enormous returns. The three per cent. income tax reaches all such, and the government and the country at large, derives important advantages from the values created by the circulation of the money taken out by the fortunate owners of such claims.
All intellirent persons, we belicve without exception, who have made themselves acquaiated with the mining interests of California by personal observation, are agreed in the opinion that no system of laws can be devised which will more rapidly develop the mines than that which nuw obtains. With regard to revenue, nuless Government despoils miners of their possessory interests, and sells the same, it cannot hope to realize much except from a limited portion of the best paying mines. The proportion of the mining yield which might thus be reached rould not much, if any, exceed one-fifth of the entire yield. The true and only practicable policy for Government to pursue is to be satisfied with the application of the increase tax to such mines as it will reach, and look for the chief benefit to be derived, to the commer cial advantages which will accrue from the increase of a substantial circulating medium. The gold which our miners are taking out is rapid'y made to create ralues which at once form permanent material for legitimatetaxation. Let Government have a care that it does not kill the goose that is laying its golden eggs with such promptness and regularity, as to make it the envy and astonishment of the world. We would close by referring the reader to the pertinent and practical remarks of Governor Stanford in his late message under the head of Mines and Mining.

Fimpranda.- Cash sales of several low priced Esmeralda stocks were made at one Broker's Office, in this city, on Friday last, to the amount of $\$ 22,000$ and cash paid down.
In the Boda Iistriet, situated eight miles west of Aurora City, the Buda Blaff Consolidated Gold and Silver Mining Company own 10 claims, representing 11,000 feet of ground.
They are taking out ore trom the New Mexican claims, which is raying sil 60 to the ton. The owners are F. If Becktil, John Bideman, Gov. Stanford and James Stark.

Wr would call the attention of Mine Owners to the advertisement in another column of a gentleman secking a position of Mining Euperintendent. Any party desiring a person to take charge of a Copper Mine will do well to avail themselves of this opportunity.

Gas Explosions.-Two private dwellings were recently destroyed, in England, by an explosion of gas. The gas escaped from a pipe beneath the floor, and although the smell of gas had, for son.e hours, warned the inmates of their danger, nothing was done about stopping the leak until the accident took place, which fortunately resulted in destruction of property only.
On Friday even ing, November 21st, an explosion, under very similar circumstances, took place, at Taylor's Saloon, corner of Broadway and Franklin streets, New York. People using gas should wateh and promptly stop any leakage, in their premises, else accident may bappen.

## Mining Stock Report.

REPORT UF SALES
At the San Francisco Mining Stock Board,
For the weck eading January 10,1863.

* 1 share to 10 inclues.

San Fruncisco, Juz. 12th, 166s.
stock remarks.
 past week, than tor any similar period during the Winter. A new class
of luyers has appeared in the Market. The cusourugng reports and regular returns from our leading mines is attracting bither a large amount of Fastern capital. The Trincipal purclases in the Ophir and Gould \& Curry Jurng the past week hnve been made on Xew York accoult.
Quite a sensation was created in minung circles on Weiluesday last in consequence of a displatel from ophir mine that a rich seam of ore had been
atruck in the lower gallery, which is being gun through the mine. The shike was made at a pociut about ejghty fect north of the Mexicau Mine. The effect has heent to gralually advance the Stock of that Company since
the reception of the dispatcl, from $\$ 2,080$ to $\$ 2,600$ per foot. Should the the reception of the dispat thi, from $\$ 2,050$ to $\$ 2,600$ per foot. Should the ble extent, farther and much targer adve: Lecs may be aulticipated. A divialend of $\$ 24$ per foot was declared on the 6th insh. Forty-three feet have changed liands during the week.
The Gould \& Curry is alco steadily improving closing the week at $\$ 200$ advance. A setlement was mand on Tuesdiy with rekard to the II8 feet atthe South end of the mine, in dispute with the Savage Compang. The G. $\&$ C. agree to pay for the same $\$ 24,000-$ hale down, halanee in 60 days.
Dividends for January on 220 feet have been sold at from 81 to 8212 z dollars per font. Sales or 131 feet are reported; buyers more plenty than sellers. The mill, whitu has been stopped for several days to fiuish up some part of the works, is abont ready io start again.
The Savage is still upvarud in is tendency-baring advanced $\$ 100$ the past every posible deyntch, and it is believed that within 60 deys, ore for
enulhing will begin to reach the surface. The developmants thus tar keem to lee entirely Rith-fuetory th hulders of stock very little of whell can be iblalthed at iressint quotntous- $\mathbf{\$ 7 6 5}$ to $\$ 800$ per fiot.
Chehlar is still bany ant, and chosed the week frim at $\$ 35$ advance.
Burzing Mo:chus, atands at about last quotitions. Luthationts aro given
 hany has got his hoistiug machinery it work.
sirern Nevida still cunthunes active at about last woeks quotations. A large business lus been done the past week, ns usual, in tha stegk. Con-

Wide Weet. Bividemils are expected frum this Company in nthout two mobths. The Stock closed this week at an advauce of $\$ 50$ un tast weel's quitations. Results from the working of the Cowpmoy's milh many to expectcd next werk.
Ant deppe hans unde an extraordinary per centage of adsauce. It closed on the 3.1 instantat $\$ 80$, and on the 10th han advanced to $\$ 152$ Real del Surte, which has remained quiet for sotme time at from $\begin{aligned} & \text { and } \\ & \text { to } \$ 20\end{aligned}$ bus al so tuken a start and ndwanced to \$ $\$$.
silver hill has also advanced $\$ 0$.

## Coso Stoclis.

The Josophine has veen luat little enquired for the past weok. It changed hands at the steck Board from 10 to 13 dollars,- Hulders asking $\$ 17$ to $\$ 20$ Coso-Not quotel, $\$ 25$ askod.
Willow springs-held at. $\$ 40$ sold at $\$ 10$.

## Mexicain Mines.

Mina Prieta finds no recent buyers, but is held at $\$ 140$.
Divs Pidre is quoted ut from 32 to $36 \frac{1}{2}$ dollars.

## WASHOE STOCK REPORT.

[Complemp frox the Dally Territorial Enterrase.]
Dee 20 h . Cnosiderable activity was noticei to-day. 25 fret in North America sold fur $\$ 5$ per foot. So fect of the Dunn Co. sold at $\$ 5$
Dec. 31st. Animation in Slocks still contivues. At no time within tho last six montha has there been greater activity in the market The majority of the Stock of the Lafiyette Co., Gold Hill District, bas recentiy passed into the hands of two or three San Francisco dealers-purchased at nominat rates. Goll Eill stocks generally in good request
Tweaty-five feet of Dunn sold at $\$ 5 ; 37$ feet of Union at $87 ; 5$ foct Buchavan at $\$ 30$ per foot-all in Gold Fill District. Inquiry for Potosi is made at $\$ 100$, but nune is olfered. El Dorado may be quoted at $\$ 03$; Birdsall at $\$ 17$; Uthhat $\$ 15$; Firriew at $\$ 00$ Zouave at $\$ 8$; Hazel Green at $\$ 450$, Sacramento at $\$ 40$; Durgau at $\$ 4$; United States at $\$ 800$ per quarter slare Cedar Hill Tumnel at $\$ 450$.
Jan. 2 n . The year begins with a gratify ing degree of aciivity, and a dearded disposition to iavest, by both home aud non-resident oprorators. 8 ft in Buchanan, Gold Eill, sold to-day, for 50 por foot. 10 ft , El Norado, a $\$ 70 ; 25$ Oriental at $\$ 4$; 10 ft Malison at $\$ 2.8$. Utah is reported at $\$ 46$
Jan. 3d. But little of note transpired. No changes noted of yesterday's quotations. The arguing of the Potosi-Chollar ease was creatiug some ininterest. Potosi still advancing aud firm at $\$ 125$.
The Enterprise thinks the favorable appearance of the Stock market, nt the present time, is a good augury of the future favorable offects of the Incorporation Law.

## HUMBOLDT STOCK.

Considerable Humboldt stock continues in market, but aside from the Mars, Cuba, Sheba, South Extension of the Shebn, and three or lour other claims, there is little or no inquiry in that direction. There is also a large quantity of Eagle and Silrer Monatain district stock, but eatirely withont quantry
buyers.
The following stocks, not enumerated above, are in the market in Virgin ia City, and held at the figures annexed :-
Santa Fe
Empire
Mcbes
Belvidore
Peytona
Durgan
ElDorado

## Wheeler's Amalgamator and Sopa-

On the first page of to-day's issue we give an illustration of a new machine, recently invented by Mr . Zenas Wheeler of this city, designed especially for separating and cullerting the amalgam from the ores of gold and silver, after the ores have been thorough'y rerluced by the most severe process of trit urati $n$ in the amalcamating pans represented on this page. The ma chine first above alluded to is calleda "Separator:" The amalgamating pans were first illustrated and described by us in our issue of December 29しh, 1862, and now reproduced on this page. They are fashioned, in their general construction, very much after the usual plan of this class of machines, "hen used with a steam chamber for the purpose of heating the pulp. Its internal arrangements present impurtant improvements over most cther pans that we have examined, and which are readily appareut to any practical miner who will carefully examine the illustrations herewith presented.
The separator is something entirely : ew and must commend itself to every ruartz miner. Tiferetofure the "cleaning up" has been made direct from the pan. which neccesearily cansed much deluy. and is, at best, but impertectly pertormed. One Separator is desigued to be used with two or three pans.

After the ore has been operated upon in the pans for a sufficient length of time to reduce it to an impalpable powder and thoronghly amalgamate all the mineral, the entire mass is drawn off into the Separatur The bottom of the pan is slightly concave, with a small bowllik depression in the center, and entirely below the reach of the stirrere. Into this bowl the amm lram, as fast as it settles, finds its way, and when once there, is at perfect rest until the macline is ceaned up. These machines have been for several months in use at $t^{\prime}$ e Zuphys Flat Alill, in Carson Falley, where both the Amalgamator and Separator hare proved themselves superior to any other apparatus in use there. BY this machine t'e babor of cleanibur up is greatly reduced and simplified. Bf the use of the Selarator, the pans are never required to be stopped except to le recharget or have the dies renerred.

Perhaps the best test of the ralne of these machines may be adduced from the fact that no perceptible loss of quicksilver has yet been noticed, from the working of this machine, which cannot be said of
any other in use. All mivers who hive examined these machines speak most for them. They may be seen in operation every day at the Mi ners Foundry, on First street in this city.

The issue of the Press containing the illustrated descrip tion of Wheeler's amalgamator having been exhausted, and having had numerous calls for the same which we have been unable to fill, we re-produce the jllustrations, to.day, in connection with the "separator," which appears upon our first page. See eritorial notice in another column.
The upper of the three accompaning engravings repr se ts a perspective riew of a new amalgamator recently patented by Mr. Zenas Wheeler, of this city, as it appeurs whell at trork.
The enzraving upon the left represents the amalgamator npened. In the bottom of the pan M are seen the dies L L $\mathrm{L} L \mathrm{~L}$. The inclin d spiral leiges K K on the side of the pan are desinned to create an upward current of the pulp by which it is forced again to the centre of the top of the wuller, and thence though a proper cpening, underneath the same, for re-grinding. This current is kept up. so long as the machinery is in motion, and by thus constantly chan-

ure are designed-the lower one to carry steam to the steam chamber, beneath the bottom of the pan for heating the pulp. and the upper one to convey the steam directly to the pulp in the pan.

California Made Pianos and Musi cal Artists.
Agreeably to au ilvitation we ro paired to Tucker's Academy, a few days since, where it was amounced that a Musical Mutince wonld take place. Although the day was inclement, the Hall was filled to overflowing. The Academy Rooms however, we are pained to say; are fir from being suitable for chasto masical performances. The stage was occupid by two grand Concert Instruments, reccutly manufac tured by the celebrated Piano maker, J. Zech, on California street, and are the finest ever made on this Coast. The quality of their tone is far better and more agreeable than the se imported. Their external appearance is chaste and exquisite. Zech's Pianos haye become popular on this C'oast. and he cannot be excelled in the mamfacture of this instrument lyy the most renowned makers in Luiope or the Atlantic States.

The Mrulinee was produced with great effect by the following artists :-Pianists, Messrs Rodo' Sipp, Staderman, Evans and Shultz; Flutist, Capity; Violincello, Stochr, and our esteemed friend, Ehrich, Violi.1 Primn.
The selections were from the greatest masters. We hare neither time nor sace to offer comments upon the several prothetions pertormed, but would remark that they were rendered in a style and spilit truly artistic and, as, such, rociferously applanded. The itclemency of the weather has athad effect generally upon string instruments, which was partly the cause of the exclasion of DeLerints Concerto as amoun ed, and which would have proved the gem of the day. It is rumored that a subsaription Quartette of striner instruments will soon be inangurated here when only Muzart's, Buothinaven's, Memeldsolu's und other celebrated productions will be given. We wish it a speedy succesc. It will have our aid.

The Nff Qulartz Milt, a working model of which was recently in operation near the corner of Third and 'tomnsend streets has since that time been much improved by the patentec. Mr. Pond, and a new one of larger dimensions is now at the Miner's Foudry, nearly completed It will be in rperation in a few days. Nutice of the me will be miven in ging the particles, every portion of the ore is soon reduc- now at the winew days. the moruing papers. Hlu tratwe engravings of the same by the ordinary mullers, where no such curvent is estab ished. I he letters $G G G G$ represent the mulier raised from its place in the botton of the pan with the face turned toward the observer, exhibiting a set of shoes, which, like those in the bottom of the pan, are also moveable, and may be read ily replaced when worn ont. The letters II represent supports for the statiunary wings D D I) as represented in the engraving upon the right. The office of these wings is to aid in forceing the current of cre to the center of the panas described above.
A, in the engraving upon the ripht rep resents the support of the jnere cud of the wings which are adjustable by the screw II upou the top of the shalt $C$. B is the driver, which carries the muller E . G G represent an end riew of the shoes on tue face of the muller. F F are inclined spiral threads on the outer edge of the muller. which in connection with the spiral ledges on the 1 an create the upward current as before described.
The steam pipes represented upon the left of the upper figare unw bemg prepared which we hope to lay before our readers nexi week. This is one of the most original Quartz Mill Inventions we have seen for a long time, and bids fair to prore a,must complete success.

Rudutipil Sitp-Piamist and Composer.-We have been farored with the acquintance of the gentleman whose name heads this notice. In an issue of the Leipzig Illust, ated Joumal dated April 8, '57 we find a high compliment paid him as aartist of merit, at the same time annuucing his departure for South America: Mr. Sipp is our Countryman, a's well as an scholar and a gentlemab and we bespeak for hm a long and continued snccess in California, His musical compositions rank among the best.

A Contract,-IIoratio Lomhard, of Chic: go. has obtained from the War Department a contract to fulluw the amm of the Potomac and collect the bides and tallow of all the cattle slaughtered for the use of the omiy. There was a rod deal of competition, there being over forty bidders. ir. Lombard's was $\$ 780$ per head, and was accejterl

## Regaraing Patemis.

We desire to call the attention of all those who intend applyiny for l'ateuts, to onr cuprior facilities for whaning the sume. Cor arrangements are sueh that we can late all
the papers preparod.transmitted and returned. with the l'atent Rijht, in threer montha from the time the applicant phaces the mattor into our lands; thus karing at least three monthe delay.
Ther expense to the applicant would he mather less. if the busiassas he durse lyy us. than if the paper:s wero sent to Nesw lurk or Washington.
Thus hy patruniziar a lome institution, our inventive citizens can save both time und money

## PROSPECTING FOR COPPER.

As the altention of prospectors, in California, at this time, appears to be very generally directed to Copper, as a present speciality, we have thought it might be opportune to give a few hints which may be of service in such researches.
The ores of copper are quite nnmerous and presenta great diversity of appearance; $y$ it they are all very readily distinguished by certain chemical re-agents, from noncrpreous ores. The presence of copper in any ore, even to as low a per centage as a fraction of only one per cent, may be readily ascertained by first calcining and then finely pul verising the ore and subjecting it to a bath of water of ammonia, when, if copper is present, the water will assume a blue tinge, more or less intense, according to the amount of copper in the ore. A teaspoonful of pulverised ore dropped into a two ounce vial two.thirds filled with the above men tioned liquid is about the proper proportions to be employ ed in the test. Nearly all the ores of copper may be readi Iy distinguished, after a. little experience, from the appear ance of a greenish tint upon their surface, more or. less observable, and sometimes verging upon purple or blue.
The ores of copper are divided, by metallurgists, into 13 different classes, and each class is subdivided into many varieties. The richest of the ordinary ores appear under two general aspects: the first having a metalic luster of copper sed, brass yellow, iron or blackish gray, at times inclining to blue; the second is without metalic appearance, of a reddish color, verging upon purple, blue or green, the last being the most usual tint. The classes of ore most frequently occurring are Native Copper, Sulphuret of Copper, Copper Pyrites, Gray Copper, Sulphate of Copper, Carbonate of Copper and Arseniate of Copper. Native Copper, so far as we have learned, has never been found, to any extent in this State, although it occurs in greater or less abundance in most other copper regions hitherto explored. It is found in greatest abundance in the mines on the Southera shore of Lake Superior. The most common ores of copper ara sull phurets and oxides the former being the most abundant.
Sulphuret of. Copper occurs in all considerable copper districts, and especially in Cornwall. This is also a class of ore which seems to be very abundant in California. The color of this ore is a blackish lead gray, approaching, at times to tarnished blue or green. It is considered one of the richest ores, and generaffy occurs in very heavy veins.
Copper Pyrites greatly resembles, in appearance, sulphuret of iron, common in the gold beariug quartz of this State, atd will probably prove the most abundant of the copper ores on the Pacific Coast. This with the sulphuret of copper, forms the chief yield of the copper mines of Cornwall. The color of the Pyrites is brass yellow, subject to tarnish, with greenish black streak and uneven fracture.

Cooper Pyrites are readily distinguished from iron pyrites, which they greatly resemble, by their inferior hardness; they may be cutwith a knife, while iron pyrites will strike fire with steel. A marked difference may also be noticed in the effects of nitric acid upon the two substauces, They do nol form so rich an ore as sulphurets. The richiess of the Pyrites may generally be judged by their color. If they
present a fine yellow hue, aud readily yield to the hammer, they may be considered a good ore; but if they are hard and of a pale yellow color, they are mixed iron pyrites, ald consequently comparatively barren of copper and constitnte a poor quality of ore.

Carbonate of Copper is of a blue or light green color, with pale green streak. It often occurs in beautiful green chrystals. It is also known as Malachite. Green Malachite or Green Carbonate of Copper admits of a high polish, like marble, and when obtained in large slabs, is often formed into tables, mantel pieces, etc.

Arseniate of Copper is of various shades of olive Green, and sometimes occurs in beautiful blue cbsystals. It readily melts before the blow-pipe, throwing off fumes of garlic odor. This ore is but little worked.
Gray Copper ore is of a steel gray color, more or less deep, either bright or dull. The value of this ore is often very materially increared by reason of the silver: which it coutains: It is generally accompanied, to a greater or less extent with copper pyrites.
Sulphate of Copper (Blae Vitriol,) is similar to the artificial salt of the laboratory: The water luwing from mines of this variety of ore is of a blue tint, caused by the solution of this salt. Copper is easily obtained from this water; in a metalic state, by depositing pieces of serap iron in it.
The ores above named are about all the ores of copper which are worked to any extent. The copper of Lake Superior contains about 3-10ths of one per cent of silver. The copper of this State, mostly if not all, doubtless contains 2n appreciable quantity of both gold awd silver. Of this we shall probably receive more deffinite knowledge when full returns are received from the ores which have been shipped Enst for reduction. Many of the mines now being explored for copper; have heretofore been worked for gold, and abandoned because they would not pay. As our miners become familiar with the characteristics of copper ores these mines are being rapidly re-located, and worked for their legitimate yield, which, as a general thing, will be found to be mucl more profitahle and enduring, than any ordinary yield of the more precious mineral, so generally sought for in California. A. little science will be found of vast impor tance to the practical miner everywhere, and especially in California, where the mineral deposits assume such a great variety, and are found in such unprecedented profusion.
Our miners according to presentindications, will soon beOur miners according to presentindications, will soon become as familiar with copper ores, as they have, for the last ten years, been with gold. We shall, from time to time take occasion to throw out sach practical hints as may be deemed for the advantage of those engaged either in prospecting for ores, or raising and reducing them.

San Francisco Physiological Society.-Articles of in corporation in favor of the San Francisco Physiological So ciety were filed on Tuesday last, in the office of the County Clerk. This is a benevolent and scientific association which proposes to cultivate the science of human physiology, and to elevate woman to a standard of physiological knowledge

## MINING SUITS IN WASHOE.

The Territorial Enterprise of Tirginia City speaks as follows of the Miuing Suite now in progress or contemplated in that neighborhood: "Lawsuits and the rumors of lawsuits have been the talk of operators and the study of lawyers during the past week. The arguing of the Potosi-Chollar case before the Supreme Court, seems to have suggested scores of opportunities for litigation; and any number of injunctious and ejectments loom up in the future. Like a contagion, however, this condition of affairs must soon die out from the want of subjects, or be dissipated by a purer atmosphere, when the real owners of claims will be all the more secure in their possessions for the ordeal of menace and litigation through which they have passed.
Prominent among the approaching suits mentioned, are -the Sacramento and Meredith ; the triangular case of the Baltic, Uncle Sam and Sweezy ; the re-opening of the North Potosi and Hale \& Norcross suit ; the Savage vs. the North Potosi; aud more remote; but not less certain, the Rogers and El Dorado squabble. The Sacramento sues, to quiet title, near a dozen mining companies on Cedar Hill ; but the suit, it is well understood, is aimed at the Meredith, and will find a hearing some time next month. The second case mentioned gives promise of being long. and spirited. The Sweezy first located the ground in dispute, the Uncle Sam re-located it, and the Baltic claims title through a Constable's or Sheriff's sale of the ledge for debt. The Sweezy plea is that the claim was never subject to relocation, the Uncle Sam that it was abandoned by the Sweesy and illegally transferred to the Baltic, and the Baltic that the Sweezy did abandon and the Balicic did acquire possession through the sale referred to. The suit between the North Potosi and Hale \& Norcross, won not long since by the latter, need not be explained. The Savage now threatens suit for the remainder of the ledge left the Potosi by the Hale \& Norcross verdict. The Potosi will endeavor to prove that the ledge it is now working lies in front of the Savage claim. The most interesting case, perhaps, is that of the Rogers aod EI Dorado-all the more so, as the ledge in dispute is presumed to be of great value. The Rogers stock has found its way, to a great extent, into the hands of heavy operators, but the El Dorudo seems sanguine of its ability to place the Rogers stakes three hundred feet west of the Montour ledge and maintain possession of the expensive works now seen on the contested ground.
The Yellow Jacket has also commenced a suit against the Union, Laboring and Princess Companies, to quiet ti-

Capitalists wait with some auxiety the decision of the Su-
preme Court of the Territory, in the suit of the Chollar Company vs Potosi Company, in the event of reversion of judgment, the Potosi would advance to three times its present rates, and an advauce may be reasonably looked for in Chollar stock if the judgment of the lower Court receives confirmation.
The value of the ground now pending in the strit between the Chollar and Potosi Companies is variously estimated at from five hundred to one million of dollars.

## MINING NOTABILIA.

## virginta city and vicinity.

The Pioneer Company, on Commercial Ledge, iu Virginia District, says the Tirginia City Unon, who bave been for more than two years running in a tomel struck their ledge a few days since, and lave now a very fair prospect of getting some of their money back again. The rock has every indication of being rich in both gold and silver.
The Caledonia Company, Gold Hill District, after running a tannel 1700 feet in length have struck the ledge and found exceedingly good rock in it. Verily industry bath its reward.
The Granite mill, at Gold Hill, cleancd up a three day's run, Dec. 29, and realized 96 pounds of retorted amalgamsilver and gold.

## hembold mines.

Some very rich specimens have recently been exhibited in Virgivia City from ratious Humboldt mines. 'I hey were from the Moonlight, Chameleon, Sargent, Osceola, and other ledges, chiefly in the Buena Vista District.
Some apparently very rich ore from the Sheba mine was exhibited in this office, a few days since, by Mr. Jos ph Powning. He assured us that they had a hage pile of the same sort at the moath of their tunnel.
There is as yet a degree of indefnite knowledge with regard to the Humboldt mines, that operates very unfavorably upon the sale of its stock. We trust the results to be soon obtained from the various mills now about going into opera tion there, will speedily dispel the cloud restivg upon these mines and reveal the shining ore in the richest profusion.
The apparent richness of the Sargent ledge is still a matter of much interest. It was discovered by a newly arrived emigrant, in the latter part of November last. At the point where it was first discovered the ledge is reported four feet wide, and it said to assay as high as $\$ 900$ from the top rock A short tunnel is now beivg run iato the ledge to open it at a sufficient depth to arrive at some aprox:mate estimate of its value. The fortunate discoverer expects to beat the Ophir when he gets down a few feet. The Brutus is the name given to another newly discovered ledge in the same vicinity said to be also very rich.
A Company has been organized for the purpose of runninga double track tunnel into the main mountain, at the head of Congress ravine, near Unionville. This enterprise, when completed will be of great beneft to the numerous mines in that hill, all of which will thereby be thoroughly prospected.
A Map of the Humboldt mines is in course of preparation by Messrs Millson \& Washbarn, which is said to be ve ry correct and full in its details. It will be a very valuable publication.

## reese river mines.

The Reese River Mines are attracting much attention, and a number of parties are organized in Virginia City for a thorough exploration of that country. Fine specimens of silver ores from that region are on exhibition in that. city, and stories of the richness of the new mines, calculated to excite, are in circulation. Such reports, however, should be received with much allowance.
Three ledges have recently been discovered, on Reese River, which afford already incontestible evidence of richness. Several specimens have yielded from 60 to 75 per cent pure silver. The names of the ledges are the "Oregon," "North Star," and "Lander." Dr. Veatch has some magnificent specimens taken from these claims which will soon be deposited in the "Occidental cabinet" in this city. A "floater," very rich, and weighing some $151 / 2$ pounds is also in the Doctor's possession. The weather on Reese River is very inclement, and considerable snow has fallen during the last month.
Tee Troffle is said to be disappearing in France. This production has neither stem, fibre nor root; and no researches have succeeded in discovering the germs from which they are developed. The truffe will not grow in land that has been manured; it loves a wild, uncultivated soil, enriched only with the rotten leaves of the forest, and demands both moisture and sun for its development. The truffle can only be cultivated indirectly by plantipg groves of the peculiar species of oak among whose roots it is found ${ }_{f}$

## titlee to mining claims.

In the case of Merritt \& Brown vs. Judd \& Byrne, decided by the Supreme Court, the Judges say:
"From an early period of our State Jurisprudence, we have regarded these claims to public minerd lands as titles. They are so practically. It is very evident that the Goverument will uot change its policy in respect to them- that they
will not be sold, nor the present tenure altered will not be sold, nor the present tenure altered. Our Currts have given them the recognition of legal estates of freehold, and so, to all practical purposes-if we except some doctrine of abandonment, not, perhaps, applicable to such es-tates--unquestionably they are, and we think it would not be in harmony with this general judicial system to deny them the iacidents of freehola estates in respect to this matter. If to decide thus be a departure from some technical rules of lawt, it is but following other rules, which hold that a system of decisions, long established and long acted upon, shall not be departed from when importantrights have vested under it, merely because the reasons upou which it rests might not. in the judgment of subsequent Judges be considered sound. We can see no difference in respect to the principle between a house built upon pultic land, and a fixture ; the reason which makes one a part of the inheritance, applies to the other, and it is only by denying the vendee, or quasi owner the character of oryuer, that the legal conclusion can be escaped, that the title to the land, whatever it is, carries with it the title to the structure annexed to the soil."

Mending Water Pipes.-The Scientific American give a rery simple and ingenious plan for mending or repairing water pipes where the water cannot be conveniently shut off. The operation is described as follows, by a corre-pondent of that paper: "In going to my office a few days since, my way led past a place where a man was repairing a lead pipe which had been cut off, accidentally, in making an excavation. There was a pressure of water of more than fifty feet head. His plan seemed to me to be novel and ingenious. The two ends of the pipe were plagged and then a small pile of broken ice and salt was placed around them ; in five minutes the water in the pipe was frozen, the pluga removed, a short piece of pipe inserted and perfectly soldered, and in five miautes more the ice in the pipe thawed and the water flowing freely through it. It seemed to me that so simple a method of doing a somewhat difficult piece of work should be more generaly known, and I know no way of reaching the mechanics of the country so readily as through the columns of your interesting jouraal.

Rearing Plants by Steam.-Mr. D. Moore, in his report to the Royal Dublin Society, describes the garden of Mr. Borsig, at Moabit, near Berlin, where there is a fine private cellection of plants, the grand features being the amazing number of tropical aquatic plants cultivated in the open air. This is effected by supplying a winding stream which passes through the garden with a constant flow of hot water from the adjoining iron works. This stream is about 100 yards long by 20 wide. Only three years ago a single plant of Nelumbium speciosum was planted, which has already spread itself over a great portion of the stream ; and Mr. Moore saw not fewer than 100 exparted blooms of this loviest of flowers. At the same time there were many flowers of Fictoria regia, Nymphcea Devoniana, Nymphee coerulea, Nymphrea dentata, \&c., altogether producing such a charming floral picture as can hardly be imagined.

Preventing beer from Turning Sour.-A French chemist has discovered a chemical compound, by which, upon the addition of a quantity of it, according to the quantity of beer operated upon, it prevents the beer passing into the acetous fermentation, and keeps it in a perfectly sound condition for an almost indefinite space of tine, no matter the quality of materials used in its manufacture; but as beer, dcc., are exciseable articles, and the penalties heavy if found adding any substance otherwise than that allowed, the discoverer goes to the Board of Inland Revenue, states the discovery he has made, wishing to know if any brewers using it would be prosecuted. The Board reply by saying it must receive a searching analysis by their chemists, to see whether it would be injurions to the consumers. In a subsequent communication from the Board, a reply is given that it possesses no injurious qualities, and he is allowed permission to use it. He is about getting a patent for it, as to have used it without the sanction of the Board, prior to obtaining a patent, would have subjected him to heavy penalties.

Mining Stock and Exchange Board at Aurora City--Esmeralda.
A Mining Stock and Exclange Board has been organized at Aurora City, Esmeralda, the object and method of operating which is explained as follows, in the Aurora Star:-
"An examining comarittee, consisting of five and at preseut composed of the folluwing gentlemen : Messrs. John Neidy, Henry Bequette, E. Green, A. D. Allen and Peter Oppenheim, all of whom are old residents, and whose experience in quartz on the Eastern Slope, is not to be excelled, upon the request of an incorporated company, visit the mine, break the rock from the ledge itself, taking the centre and ontside strata, lave it assayed and file the certificate of assay among the archives of the Board. A specimen of the rock is also properly labeled, with the amount it assays marked upon it and placed in the cabinet of the Board. At the regalar meeting of the Board the reports of the examining committee are read, stating the number of leet in the lode, character of the ruck, width of the vein, amount of work already performed, and the character of it-the capital stock, number of shares, resources and indebtedness of the corporation, and present the certificate of assay which is filed by the Secretary.
The Board then proceed to classify it, as No. one, two or three, according to its assay, and appraise the value of the stock, after which it is placed upon the regular lists, and together with other regular lists of stocks, will be published weekly, and a certified copy sent to the Board at San Francisco, who are instructed to pay no attention whatever to stocks not reported in the regular lists here, which will drive all fictitious, spurions and "Wild Cat" stocks out of the market. The innocent purchaser will be spared from being robbed, and claims which have a real value, will take at once their proper place in the published lists, and the credit of the District will be well maintained."
The Bids offered at the first meeting of the Board will be found under our general Stock Report.

Calformia Exports for 1862.-Includiug our Exports of Treasure, the entire exports of the Productions of the State of California, during the year 1862, are classified by the Mercantile Register as follows:
Products of the Mine..

$\$ 48,773,540$
Rev. F C. EwEr.-This gentleman, so well known in California, was recently installed as Rector of Christ Chureh, on Fifth Avenue, in the city of New York. This is one of the finest structures in that great city, modelled after the Madeluine, in Paris, with domes and no side windows. The congregation has doubled, we are told, since Mr. Ewer's election as Rector. This is good news to the many frieds of the reverend gentleman in this city.
Quaytz Mills not Subreot to Federal Thaxation.-Mr. Boutwell, Commissionor of Internal Revenue, writes D. K. Swim, Assessor of Calaveras and Tuolumne District, that Quartz mills are not subject to taxation under: the Federal revenue laws.
Academy of Naturas Sctences.-The following named gentlemen have been elected officers of the Californis Academy of Natural Sciences for the ensuing year: President, Colonel Leander Ransom ; First Vice President, Dr. J. N. Eckel; Second Vice President, Dr. J. B. Trask; Corresponding Secretary, Dr. Wm. O. Ayers ; Recording Secretary, Professor W. H. Brewer ; Treasurer, William Heffley; Librarian, Professor T. D. Whitney. Curators-On Mineralogy, Gideon F. Moore ; on Botany, Dr. A. Kellogg ; on Yaleontology, M. Sabb : on Concholugy, Dr. J. S. Cooper; on Entimology, Dr. H. Behr.
A Mint for Netada T'errtrory.-In the House of Representatives on the 9 th inst., Mr. Sargent introduced a bill establishing a Rranch Mint in Nevada Territory, which was referred to the Committee of Ways and Means.

Iona Copper Mining Company.-The annual meeting of Stockholders for the election of oflleers, will be held, Jan. 23 , at oflice. No. $5 t^{2} 2$, Montgonery street.

Live Oak Copper Co.-The Annual Meeting of Stockbolders for clection of Trustees, will be held at Office, in Muitgonery Bluck, Feb. 2, 1s6:3.

Coso Silver Mining Co.-The Office of this Company hns buen removed from the Stevenson Honse to Nos. 11 and 13 Cunrt Block, No. Gi36 Clay street between Nontgomery and Kearny. Entrance on both Clay and Merchant streets.

Cembar IIIl Tombel and Mining $\mathrm{Co}-\mathrm{A}$ adjourned meetjng of storkhohlera will bu held, Jan. 15, at Unice, Room 5 , over Pariot's Bank.

Mima Printa S. M. Co.-An assessment of $\$ 10$ per share was levird. Dec. 26, 1862-payable at office, cor. Montgomery and Jackison Sts., on or before Jan. 26, 1863.

Savage Mining Co.-The Annual Meeting of the Stockholders of this Co. will be held at Olice, 712, Montgomery St. Jun. 13.

Union G. \&S. M. Co.-The regular quarterly Meeting will be held, at Office, 410 , Montgomery St., Jan. 19 .

The Madison G. \& S. M. Co. advertise names of parties who are in arreas for assessments, and give notice that their stnek will be sold on the 29th day of Jan. unless said assessments are previously paid.

Franco-Americano S. M. Co.-The following persons were elected officers at the meetiug of trnstees. Dec. 26 thChas. F. Gaian, President and A.S. Gould, Secretary.

The office of this Compiny has been removed to No. 528, Clay street, Room No. 2.
Sierra Nevada S. M. Co.-The annual meeting for the election of 'Trastecs will be held at office No. 40, Montgomery Street, Jan. 12th.
Lucerne Mining Co.-The Annual Meeting for the election of 'l'rustees will bo held at Office 114, Battery St., Jun. 12th.

Central Silver Mining Co.-The Annual Meeting for the elertion of Trustees will be held Jan. 13, at Office, No. 712, Montgomery street.
Lady Bryan G. \& S. M. Co.-Shares of delinquent stockholders will be sold at auction for asseasments, at No. 400 , Montgomery steet, ou Jan. 27.

Desert Mining Co.-Shares of telinquent stockholders will be sold at anction, for assessmants, at No. 400, Montgomery street, Jan. 27.
Wide West Mining Co.-Tbe Jecretary of this Company publishes an important notice to Stockholders, in the daily papers.
Reese River Mining Co.-Ten cents per share has been levied upon the capital Stuck of this Company, payable Jan. 14th.

San Francisco S. M. Co. have laid an assessment of $\$ 25$ per share, rayable on or before Jan. 1st, 1863.
Pacific Quicksilver Mining Co.-Assessment No. 3, of \$1 per share was levied, Dec. 22, payable immediately.
Keyst ne Copper Mining Co, advertise for preposals to purchase or treat 3d quality copper ore. Proposals received till Jan. 15th.
Mammoth Ledge Mining Co.give notice of an assessment levied and payable on or before Jan. 13th. Also that the first annual Meeting for the election of Trastees will be held at office, Jan. 17th.
Hale \& Norcross s. M. Co. have levied an assessment of $\$ 5$ per share payable on or befure Jan. 26 th.

Charliss Cany Mining Co.-An assesment of $\$ 150$ per share was levied on the stock of this Company, Dec. Itth, 1862, payable on or before January 14th, 1863, at office, 338 Montgomery St.
Live Oak Copper Mining Co.-Office, Montgomery Block - An assessment of thirty cents per share was levied, Dec 1st, 1862 , payable in thirty days.

Norti Potosi Shlfer Mining Co.-An assessment o four dollars per share was levied on this Company, Dec. 11 1862, payable on or before January 16th, 1863, at office,
Cor. Battery \& Washington Sts. Cor. Battery \& Washington Sts.
Meredinie Gold \& Siliver Mining Co.-An assessment of two and a half dollars per share (five dollars per fo $t$ ) was levied by this Company, Dec. 11th, payable immediate1y, at office, 712 Montgomery St.
Bullion G. \& S. M. Co.-The Stockholders are notified
that they will hemr something to their advantage by calling at the ullico of the Comshany, cor. Pine und Montromery sts.
Nortas G. \& \&. M. C'o-An assessment of two dollars per share was levied Nov. 25, payable on or befure Ilec. 30th 1802, at oflice 5\%2 Montganery sit.

Ihos l'inare (i.d.s. M. ('u.- In assessment of threedollars per hare was leviedi, Nov. 29th, payable on or before Jan. 1st, 1863 , at otlice 502 Moutgomery St.
Emaet G. \& S. M. Co.-An assessment of twenty-five cents per share was levied. Nov., 21 st and is now due, and payable at office 326 Clay St.

Vibsard G. if S. M. Co.-An assessment of 25 cents per share was levied, Nov. 21st, and is now due at office 326 Clay St.

Doyma (G. \& S. M. Co.-An asessment of 25 cents per share was levied, Nov. 21st, and is now due at office No. 326 Clay St.
El Dorado G.\&S. M. Co.-An aseessment of one dolnir per share was leried, Dec. lst, and pryable at oflice, on N. E. cor of C'aifornia and Montgomery sits., or to super intendent in Viginia City.
Another assessment of one dollar per share was levied Dec. 22, payable as above.
Iowa Mining Co.-An assessment of Four Dollars per share was levied, Dec. 4th, payable at office 522 Moutgomery St. on, or before Jan. 3d, 1863.
Josepuine Mining Co.-- $\Delta n$ assessment of two dollars per share was levied, Nor. 19 th, and is now due and payable at office No. 21 Stephenson House.
Buraside S. M. Co.-An assessment of one dollar per share was levied, Nov. 17 th, payable within 30 days, at office 712 Montgomery St.
Hawley Mining Co.-An assessment of 50 cents per share was levied, Nov. 15th, payable at once, at office 204 Front St.
American Quicksilver Mining Co.-An assessment of ove dollar per share was levied, Dec. 16th, payable at Company's Office, in Petaluma, within 30 days-At the expira tion of which time delinquent Stock will be sold.
Napoleon Coppeir Mrning Co.-The first annual meeting of this Company will be held at office N. E. corner of Sacramento and Montgomery Sis., on Monday, January 12 th 1863, at 8 P. M.
Burning Moscow S. M. Co.-An agsessment of Two Dollars per slare was levied, Nov. 25, for the purpose of defraying expenses of stean pump and machiuery now being erected to drain the mine. Prompt payment is requested at the Company's office, corner of Monigomery and Jackson Sts., to Jos. P. Nourse, Sec.

## WASHOE MINING NOTICES.

Baltic Mining Co.-Notice is given of an adjourned salo of shares in this Company, to take place on the ground, Jau. 31st.

Progress G. \& S. M. Co.-An assessment of 20 cents per foot was levied, Dec. 27, 1862, payable forthwith.
Sweesy Co.-Washington Ledge. - An assessment of $\$ 10,000$ being $\$ \overline{5} 1 / 2$ per foot-was levied on the stock of this Comyauy, Dec. 28, payable at the Secretary's Office. Medan Building.
Miners' Meeting.-At a meeting of the shareholders of the Siegel Mining Compauy, it was resolved that a meeting be called of all the miners of the Siegel Miniag District, for the purpose of making laws by which said District may be governed, and that said meeting shall take place on the 15 th day of January, 1862, in said Siegel District, in or near a certain place better designated as the Siegel Min ing Company's Cabiu.
Caution.-D. M. Tyrell warns persons against purchasing certain 10 feet of ground in the Wellington Co., standing in the name of J. B. Magee-also 20 feet, stauding in name of W. Williams. (See Territorial Enterprise.)
Ashland Co.-I. A. Gould, in the name of the Moss Co. notifies the Asbland Co. that their westerly drift has cut the Lamb ledge, in the Moss Co.'s ground, from which the Ash land Co. is forbidden to extract any valuable metals.
Eldorado G. \& S. M. Co.-An assessment of one dollar per share was levied, Ded. 31, 1862, payable, Jan. 22, 1863, to the Secre'ary, at corner of Montgomery and Califoruia streets, or to the Superintendent at Virginia City.
La-Plata Oro Co.-Gold Hill District.-An assessment of two dullars per share was levied, Dec. 26, payable at once, at Office of the Secretary, Court-house Bnilding, Virginia City.

Texas Co.-Tennessee Ledge.-An assessment of 25 cts. per foot was levied, Dec. 22, payable on or before Jan. 21, 863.

The Regular meeeting of the Company for election of officers, will be held at the Comet Saloon, Virginia City, on Saturday, Jan. 21.
The North American Co., Gold Hill, will sell at anction,

Jan. 31, stock of shareholders delinqneut in payment of sesuments.
Girass Valley ('o.-A mecting of this Co. will be held
the "Medan," in Virginia City, on Thursday, Jan. 15.
Asmbina G. \& S. M. Co.-An assesement of fity cents
per shati, was le vied, Dee. 10, payable at the oflice of M. J. 1'ower, sec., B. St.
Norman Shever Minino Co.-An assesement of One Dollar per share was levied, Nov. 19 th, payable on or before Dec. 31st, to the Superintendent in Vireinia City, or at the office, No. 40, Montgomery Street, Sun Franciseo.

Martin Wibte Mining Company.- An assesement of ten oents per foot has been levied, payable to the Sucretary, at cffice on C Street, Virgidia City,

Thr Sweney Co., Gold Hill, give notice that Baltic Company bave wrongfuly claimed and worked their ground since July, 1860 .

Pogrman G. \& S. M. Co.-An assessment of Five Dollars per shure was levied, Nor. 94h, and another of Ten Dollars per share, Nov, 21, payable at onco to the Secretary, R. J. Mischel.

Colebona Tlineel and Mining Co.-An afsessment of Thirty-two Dollars per share was levied, Dec. 8th, payable immediately to the Secreary, Martin White.
The Chmaey Rock Co., lying next west of the Virginia Co. claims have notified the Hazel Green, Tingley and Bach \& Paxton Companys that they are tresspassing upon the Chimney Rock Co's ground.
La Croser Mining Co.-An assessment of $\$ 22$ per share was leried, Dec. 8th, payable at office 73 C Stieet, Virginia City.
Hafk Eye Silver Mining Co.-An assesement of 25 cents per foot was levied, Dec. 6th, payable immediately to S. A. Kellogg, Sec. Gold Hill.

Monegan Co , Cedar Hill.--An assessment of fifty cents per foot was levied. Dec. 5th, payable forthwith, to the Secretary, at Virginia City.
Oriental G. \& S. M. Co.-The 3d asseesment of 15 cents per foot, was lev'ed, Dec. 8th, and is payable at office, No. 31, C Street, Virginia City.

## ESMERALDA MINING NOTICES.

The Zenobia Lode Company, give notice that they claim a superior title to the Johnson Co., claiming the same ground, so far as said localities couflict. This ground is a portion of that now held by the Company known as the Wide West Company. The notice is signed by A. Waddell, J.C. Dorsey. S. P. Dorsey avd James Elder,

## MINING AND SOIENTIFIO PRESS.

## THE ONLY MINING, MECHANICL, AND SCIENTIFIC PAPER ON THIS CONTINENT.

## THIRD TEAR: VOLUME VI.-NEW SERIES।

1862. In wr volume of this extensively circulated paper commenced Sept. 11, 1862. It is intended that every number shall he replote with information concerning Mining, Suientific, Mechanical and Industrial pursuits, togather with several origmal engravings, of new inven folums. etc., prepared expressly This paper is of Suience, Ar devoted to the above purposes, togother with the interests that may be of intericulture and Commerce, and any general information tor to spare no pans or expense in raasing it equal in interest and valuable ormation to any paper yet published.

## The Mining Tnterest I

Will fand it of great value, as it will contain all the newsenpportaining to Miving, the prices and sales of Mining Stocks, new inventions of Machivery to the Miner.

## The Inventor:

Will find it an excellent medrum for the purpase of bringing his invention into notice, of ascertaining the progress of inventiou in this and other countries, and also of receiviog any liforming hat may be necessary Patent Agent, together with facilities at Washington that enable him to ob ain Pateuts with dispatch.

> The Mechanic and Manufachurer !

Will be greatly benefitted by its perusal, as each number will contam several orizinal ongravings of new machines ava inveations, logetber with recoiving the best ecientific journals from all quarters, from whiul wo shall coutinue to extract whatever may be of benefit or interest to our
To Chemists, Architects, Millworights and Fariners !
This journal will be invaluable. All new discoveries in Chemistry will be Millwights will be found in our columns. The Farmers and Planters will not be neglected, engravings will be given of agricultural implements, and the farming interest geuerally will be amply discussed

## To Printers．

An Interest in oue of the most fournhing aud best paying Newspa－ per Offces in the mountains is offered for sation on easy terms．A rare op－ ortunily is hereby preseuted to any priuter desirous of e：tablithing him－ self in a good busiuess in one of the heallhiest，most thriving and delight． ful mountain towus iu the state．For further information enquire at this ofice．

In our issue of last week we commented at some length upon the pernicious exagerations and misstatements which characterise and constitute the late Report of the Land Commissioner to the Secretary of the＂Interior．That＂Re－ port＂has been wide．y circulated by the press of this State， and its＂hifalutin＂talk placed side by side with the plain facts of our mining growth and production．Nothing could be more cruel．Such balloon like fancies when brought in contact with any reality produces no concussion whatever．

The Commissioner at one time seemed disposed to take Mr．Sargent＇s excellent advice，to come out to Calfornia and see and learn for himself，the nature and condition of our mining interests．We trust he will do so；or at least by another year prove himself to be＂ 2 man who reads the pa－ pers，＂

Last week we said＂The Commissioner，gravely and un－ qualifiedly assumes that the yield of the current year will reach $\$ 100,000,000$ ．In another column we have given an accurate report of the shipment of treasure for the jear end－ ing Jan．1st， 1863 ，which foots up all told only $\$ 42,561,761$ ． This shipment it should be recollected has been made under the unusual stimulus of an extraordinary demand for gold at the East，\＆c．＂

Even this does not express the whole truth coucerning the product of California．It is an exceedingly slight devia－ tion from the truth to say that all the gold dug in California and all the silver produced in Nevada，quickly comes to San Francisco to be made into bars or coin．

According to the very reliable statistics recently publish－ in the＇Bulletin＇．＂the receipts of Treasure from the Interior，＂ at San Francisco，during the year 1863 ，were $\$ 42,539,799$ ． But of this amount $\$ 4,989,921$ was coin，and therefore whether the product of this year or not，had been counted once before．The amount uncoined was $\$ 37,549,878$ ，and if from this we deduct the amount which the same paper a few days before stated to be the receipts from Washoe by pub－ lic convefance，viz．，＂about $\$ 5,500,000$ ，we shall arrive at the true yield of this State during the year just passed－$\$ 32$ ，－ 049，878．
In 1853 ，it was more than $\$ 53,000,000$ ．The mathemati－ cal genius of the Commissioner alone can show how long it will take for California to reach his estimate of $\$ 100,000$ ， 000，at the same rate of increase．

We need not however go back 8 years．Again we quote from the Bulletin，correcting a slip of the pen or type for 1861 ，in which the receipts from the Northern mines are given as the uncoined treasure and those from the Southern mines as the coined ：

| Uncoined Treasure Received in San Francisco． |  |  |  |
| :---: | :---: | :---: | :---: |
| 1860. | $\ddots$ | 1861. | 1862. |
| $\$ 37,802,539$. | $\$ 35,880,632$, | $\$ 37,589,878$. |  |

That is，including $51 / 2$ millions from Washoe，the receipts of 1862 fall $1 / 4$ of a million short of those of 1860 ，when little or none was received from Washoe．

If this decrease has taken place while the mines are free to all what ought we to expect under any system of taxation whatever？

We believe however that the proposition to tax the mines has received its quietus．Gold at 48 per cent．premium，is the grandest orator uddressing the grandest audience in the world－every man in the Union－an orator that will be re－ membered long after this foolish proposition of taxation has been forever forgotten．

## OUR MINERAL RESOURCES．

The restlessness of the Califoraia miner，while，as a gen eral thing it works only disaster to the mdividual，is exert－ ing a most beneficial effect upon the community at large It is to this class of our $p$ pulation that the country is main－ ly indebted for the wondertul development of her．mineral resources which has been accomplished within the past three or four years．The Fraser river excitement of 1858 seems to have impressed upon the mind：of our mining population the idea that California was not the only portion of our ter－ ritory，on the Western Slope，which was rich in mineral Though，to a great extent disappointed in their expectations of the value of the Fraser riper mines，the adrenturers thither were determined to continue their explorations in other quarters．The result has been a most wonderful de－ velopment in both the variety and extent of our mineral re sources．The new mineral fields developed by these hardy and determined explorers，present an already extensive out lay in Washington Territory，and Oregon，and extend for hundreds of miles along the Eastern Slope of the Sierra Ne vada，and far into the interior of the＂Great Basin．＂Large cities and towns have grown up in some of these localities， which，in the marvelousuess of their growth，compare favor－ ably with the early cities of California：while the flow of precious metals therefrom forms most important tributaries to the main stream which courses so regularly through the Golden Gate．
The general yield of the placer mines of California is ev－ idently on the wane，and the development of our quartz interest would utterly fail to keep up the monthly shipments to their geoeral average，were it not for the timely supply that is coming to our aid from these new mining districts．

The amount of gold and silver now finding its way to this city from Nevada＇Territory forms no inconsiderable item in the montlily shipment of treasure to the East；and yet it must be acknowledged by all who have any acquaintance with that region，that the returns as yet are but the small beginnings of the grand total which must soon foot up as the average monthly gield of the Eastern Slope．Patient and careful explorations by experienced miners are still daily enlarging the boundaries of that remarkable mineral region． Far out on the Humboldt，nearly approaching its head wa－ ters，withiu the unexplored borders of Oregon and Wash－ ington Tervitories，the explorers have already pitched their tents and are sending to their friends here and in Washoe the most indubitable evidences of the extraordinary miner－ al wealth of those distant regions．The evidence is now overwhelming that California forms the mere wistera edge of a vast mineral field whose area comprises the entire cen－ tral portion of the North American Continent，and whose natural outlet is through this city．

These extensive developments are the chief causes that have of late years created so much confidence in the in－ creasing growth and prosperity of San Francisco．Just in proportion to the extent of the development of the mineral resources west of the Rocky Mountains，will be the future growth of this metropolis．It is now apparent to even the most casual observer，that the developments and accom－ plishments of the next decade cannot fail to place San Fran－ cisco in the front rank of American cities，while her facilities for acquixing wealth will be without a parallel in the history of the past．Located as we are，apart and at a safe distance from the convulsions，both civil and commercial，of the At－ lantic States and Europe，the capitalists of the East are already turning their attention to our mines as ai safe and profitable field for investment．Millions of capital from the Atlantic States and Europe are even now at the disposal of agents here for investment．These agents are met everywhere． They are seeking to purchase our copper ore and to invest in our coal mines．They have already made their appear－ ance in the Mining Stock Exchange，and the day is fast ap－ proaching when their bids will run up our leading dividend paying Stocks to a figure little dreamed of on Montgomery

COPPER．
New discuveries of copper ores are are constantly be－ ing reported．The late remarkable developments．in Cala－ veras County，and the promptness with which capitalists are coming forward to encourage operations in this branch of nitaing，has given a wouderful impulse to this new depart－ ment of industry．Many that are conversaut with the cop－ per developuents in the Oounties of Calaveras and Maripo－ sa，think that it will not be more than five years ere this new interest will eclipse in value and importance the gold mines of tbose caunties．
Considerable excitement exists in the vicinity of Jackson Amador county，in consequence of new and and rich copper discoveries recently made near the Mountain Spring House． The Dispat：h says the rein itsupposed to be the contioua－ tion of the Copperopolis and Campo Seco rein，and has been traced for several miles．The Amador Ledaer says that Dr．Newton＇s Company were the first to work a cop－ per lead in Amador County，and they are taking out large quantities，for which they receive an advance of $\$ 50$ per ton at the mine．Other Companies are being formed，and will soon be at work．The copper range is suppnsed to be about one mile in width，extending from some place south of Cop－ peropolis，thence through Copperopolis and Campo Seco in Calareras County，Mountain Springs in Amador County， Michigan Bar and Folsom in Sacramento County，and thence away on up beyond Nevada，in all of which named places copper ore or its indications have been discovered．
J．E．Oliphant has obtained some very fine specimens of copper from a depth of 28 feet below the surface in Mon－ tezuma，Tuolumne County，near the Zinc House．
The late discoveries in Nevada Coupty are in progress of development．Another discovery is also reported on Mc－ Carty＇s Ranch，about two miles from Grass Valley．Several discoveries have also been made a short distance below Grass Valley，of which more particular mention will proba－ bly soon be made．

Copper has recently been discovered about ten miles from Auburn，and a Coropany has been formed with the intention of giving it a thorough prospectiog．A lead has also been discovered in Green Valley，Placer County，which is report－ ed rich．
Del Norte，Mariposa，Calaveras．Amador，Tuolumne，El Dorado，Nevada and Sacramento Counties are now fairly in the field as copper districts．Developments in other Coun－ ties may soon be expected as a necessary result from the at－ tention which is now being turned in that direction． TIN，
Tin has been discovered in several localities in this State， and we notice that a Company to be known as the＂Orio Gold and Silvir．Mining Company，＂was incorporated，in this city，on Wednesday last，to work for tin as well as other val－ uable metals in Santa Clara County；Daniel Driscoll，A．S． Barcley and C．A．Mathiew are the Trustees．The Herald in noticing the formation of this Companysays：＂We have sufficient reasons for believing that the parties composing this Company have a very＇good thing＇in the shape of an extensive tin mine，which is situated within a day＇s drive of this city．It appears that the riches of cur gloricus State are just beginning to be developed．＂

## S！LVER．

A Los Angeles correspondent of the Bulletin gives some wonderful reports of silver discoveries recently made near La Paz．Ophir and Gould \＆Curry，according to these ac－ counts are entirely eclipsed！It would appear that the apoc－ ryphal Indian stories of gold and silver bullets；and nuggets， lying around loose，might yet be proven true．Bat，as the correspondent remarks if there is any truth in these reports we shall soon hear from them again，in a more definite and eliable manuer．
New silver discoveries are still reported in our own vicini－ ty．Reist \＆Co．，proprietors of an extensive quartz mill．and a rich vemn near Rawhide Ranch，in Tuolumue county，are putting up apparatus for extracting the silver from the ore found in their rock．They have lately ascertained that their rock is nearly as rich in silver as in gold．
According to the Calaveras Chronicle of January 3d there was quite an excitement in that place during the latter part of the previous week，caused by the discovery of suppo－ sed silver mines in the Blue Mountain Range，some thirty miles east of Mokelumne Eill．The Chroniclesays：－＂The ore assays rich，and quite a number of claims have already been staked off．If the lead proves as good as expected，w $\epsilon$
shall havo as rich silver lodes in this county as there are in Whathe. The pmakern of the Corporation tet by the Nevada Territorial lagistature, will induce capitalists to invest in silver leath on this side of the mountains."
The Maripusa Grizutle pronounces the rucently discovered mines in that lucality as realities worthy the atteution of the community

## COAL.

It is said thatan extensive bed of superior coal has been discuverell on Iry Creek, near Fulsom. Preparations are being made for its proper development.

## SULPHUR.

Mr. Wuntaman, according to the Territorial Enterprise of V'irginia City, haz brought to that office several specimens of pure sulphur which had been taken from a small mountain of that material, situated about twenty miles west of Unionville. The Enterprise adds:-"That locality may bo in close proximity to the lake which burneth with fire and brimstone, and it mng not-yet we are of the opinion that this item will change the destiuation of a good many moderate Christians who are now preparing to emigrate to Eumboldt. Hovever, it will give the regulars a better chance than they generaly have in mining regions."

## TEEE "DIMES" AND "WIDE WEST" CRONTROVERSY.

Some little exciteraent has recently been created in Es meralda mining circles, by reason of an injunction suit brought by the "Dimes" Company against the "Wide West," the former holding the exteusion of the latter. 'I'he facts in the cis" we beliere are substantially as follows :-The "Wide West" and "Johneon Co.," now consolidated, own a contrulling interest in the "Dimes" Company; the stock so held standing in the name of T. W. Ly'e. The minority of the "Dimes" property holders desire a division of the property, and to that end have brought a suit, and obtained an injunction against the working of the "Dimes" ground The "Wide West" Compauy are not working upon that ground, and fur the present, at least, do not desire to do so. They are confining their operations to their owa original ground. It appears that an effort is being made to mystify the true character of the controversy, and thus depreciate the 'Dimes' stock for speculation.

We have just examined, at the office of Thomas Ogg Shaw, 422 Montgomery street, some very rich specimens of gold quartz, taken from the Copper Hill Lead, Sierra county, Nevada T'erritory.

## GENERAL MINING STOCK REPORT.

## San Franclisco, Jan. 19it, 1863. Stock Remarks.

The businoss of the prat weot, although very caosiderable, dnes not equal in anount that of the weak previnus. The incerease of bu siness for
tho two weeks past may be attributed, to sume extent to orders from abroad for ngeuts hero to iovest in well established mioes,
Ophir has declined $\$ 200$ during tho week, with no apparent cause. The necounta from thefmine to date, fully confirm the favarable roports of Jast week ; the "rich strike" north of the Mexicna is now known to be a reality and more very rich ore in a gallery, just opened, is roported.
Gould and Curry has advacced nother hundred during the past weels, end have been made as high as $\$ 81$ per foot, aud $\$ 100$ is confidently expected by mauy of its friends, after the present mouth. Twenty of the forty stamps are dow in operation, and the other tweaty will probably be atarted to-morrous or lay after.
Savage is stlll improving. It is qurok in the market, and jabares are freely taken when offered at anytbing near the market price. Sanborn \& co. placo it amog the first class, and quote a sale at $\$ 1,010$, although the general rauge of this strack, during the week has been from 800 to 900 dollirs. Efile \& Norcruss has not been much in demand, during the week, It is held firm at $\$ 125$ to 130 .
Chollar has not been as nctive as last week. It started on Monday, at the
Board at \&410, and fully maintained its etund during the week. The delay Board al $\$ 410$, and fully maintained its atand during the week. The delay iu the decision of its suit with the Potosi, renders bidderars a little slyy. Thls
decieion is anxiously looked for. Putosi is still adrapelng. On Friday and Saturday it stood at the Board at an udvanco of from 25 to 30 over the last week.
Burning Moscow, as intimated last weok has materially advaneed-from 10 13 dollars to the foot. It is now quoted at \$s $7 / 2 / 2$. Farther advances are aur ticipated.
Sierra Nevada declined somewhat at the close of the week, in consequence of an assessment of $\$ 15$ per foot being lovied by the Company, on Thursdny last. The depreciation was about equal to the assessment. Cunbiderable stock has chraggd hands during the week.
Norton which has been very quiet for several weeks and scarcely quoted at all, tonk a sudden start this weelk in consequence of the report that the C ompauy "had struck it rich," , bing up from $\$ 14$ on Monday to $\$ 841 / 2 \mathrm{It}$ is
deyth if 200 feet from the gurfaco-thus fuily eatablishiug the parmanoucy of tha ir milies.
Thu Dathey, which was not heard from the week provinus, had buyers, last werek, at trom 100 to 200 thellars. Thesir fued mill, it is expeoted will go

Iowa in yruted the past week ut from 110 to $\$ 120$-Very ittlo dono

## ESIERALDA STOCKS.

kianerulina Siocks appear tu bouttractug much moro attention in thin market than firmorly. We would cill attuntion to tho motice in awother column or thu Muing stwek Raserd recently established there, and in the atock transartions reported in their approperinte place. This repart it will bo notfcel la momewhar ancent-but is tho latest which han enme to hund at biv ullioe. Our friende of the "Star" have peglocted us tho past weak.
Wide Went still continues a live inatitution und is rapidly ndvancing to the ruthe of a first class mine. It has improved from 40 to 60 dollars the pust wuek and now stauds firm at $\$ 100$. The Company are tuking out from four to tive tbousad doltars a week, at tho present time, from a very smat, itefficient mill. This stoch will doubtlose continue to advance rapidly for sume time to cume.
The Antolope has also mato a large adraneo, fully 50 per cent- on tes las week's rulus. If is now quite firmat from $\$ 200$ to $\$ 215$.

## REPORTOF ALES

Live Yubken-2 8 sharms oferud at $\$ 10$; bid 8.
Nevads-25 alures offered at $\$ 10$; wo bidders.
Del Modte -12 shares ollerod at $\$ 20$; bid 15 .

## WASHOE STOCK REPORT,

[COMTLLED FROM tTm Dall Tgrriorlat, Entarpase.]
Monday, Jan. 5th.-3tiaing operations are still being carried on with quite as much vigor an et any provious time daring the senson. The wea. ther bas thus far been extromely favorable for wiutor operations. The Duou Company'a ground still continues to present tavorablo appear. unces, and can be soid at low rates. The indicatinns are tbat the ledge insproves with its depth. The Sinola Company expect in reach their ledge soon, with their tunucl, which will strike it at a depth of 150 feet. The atock of this Company is chicfly beld by the original locators. The Unina Company have lately bud about Co tons of their rock crashed, which, though not rich, gives encouragement for further prospocting, the mine oridently improving with ita depth. Stock in demand at low Ggures. Hawel Greon and Dirgau are quict in the marset.
The Lafayette Company, Guid Hill District, the chief part of whose stock recently passed into the bauds of San Francisco capitalists, presents favorable udicutions. It is believed the enterprise will prove a paying one. Tweuty leet of the Bloomingdale eoid, to-day, for $\$ 4$ per foot. Birdsall has been eqquired for at $\$ 20$. Tweuty feet of Batic sold for $\$ 17$ per foot.
Tuesdey, January 6th.-The Summit District is beginaling to attract some attention among miners who are willing to eugage in prospecting the various leads in that locality. The Flowery Hill Company have struch some very rich rock in their lodge near the surface. They are ugw engaged in rumning a tumnel, to strike their ground at a depth of fify feet. Several Accountr from Palmyra continue favorable to the success of the mine in that District. Flowery diggiugs are not gevoraly, in demand. Claims in this locality are looked upon by those secking to invest, with a shade of suspicion, as to their permanency; the developments, thus far, having pro-
ved uufayorable for the future sticcess of these minos. There are several, however, which have been found rich at tho surface, but which have not yet been proven at a sufficient depth to determine their, real value.
But few claims in the Devil's Gate District are esteemed of much value. The Pride of the Weat may be set dowa as the ouly claim in this locality which is being successfully worked, or promses fair for future prosperity. The stock of this Compauv dues not appear in the market.
Buchanan is salcable al $\$ 60$ per foot. Ashland 18 without buyers at $\$ 10$. Zouave is offerod at $\$ 8$ Union 18 bffered at $\$ 10$, with no demuad; Hazal Green at 5 , and no sales, and Oriental is offered at 4. Operatious for the day limited and sales unimportant.
Wednesiay, Jan. 7th.-No sales of importance quoted. El Dorajo is reported at $\$ 60$; Utab at 45 ; Senta Rita "t 35; Zquavent 7; Gov. Nye at 6; Madison at 25; Fairvew at 20 Cedar Hill Tunnel at 4, 50 ; Baltic at 20; Ha zel Green at 5 and U . S. Tunnel at 750 dollars per quarter share.
Thursday Jan. 8th.-Littic busiluess, of note, was done in stocks to-day. It is a gratifying fact, however, that the limited number of transfers durjug the past week, is due more to a disposition on the part of the bolders to wait for an advance of prices, than any reluctance to invest on the part of capitai. Thi members of the Sacramento Company werc somewhat elated, to-day, by receiving the returns of some ore from their mine, crushed in this city, at Braulhhiw \& Co's Reduetion Works. Tho result of the crushing was $\$ 1,11342$ in gold, and $\$ 1057$ in silver. (We gave the item in our last issue.) Such a handsome return of ores from a secnad rate lam in the Tertitory, remarks the "Euterprise," is extremely gratifying, and affords additional evidence of the almost incalculable mineral resources of our gold

## and silver mines.

Friday, Jan. 9th, -A small lot of Palmyra stock has been preaented in this market, at rates which would no doubt bo esteemed low by those convernin with these claims; but, as yet, there is no especial demad the stock in that district. Some activity is manifestod in La Crosse, whether
from any new developments made in the claims, or the small demand for from any new dovelopments made in the claims, or the small demand for the stock, is not reported. Soveral trassactions, it is -said, have been per-
fected to-day, at prices above the usual rates. fected to-day, at prices above the usual rates.
Ashlaud is offered at $\$ 10$, Madisou at 20, Burniug Moscow at 65, Sierra
Nevada at 65 and Santa Rita at 40. $\$ 16$ is offered for Burdsall and 1750 askNevadr at 65 and Santa Rita at 40. $\$ 16$ is offered for Burdsall and 1750 ask ed. Hazel Green and Oriental are offered at low rates without aales. Saturday, Jan 10th. -The stock trade has been rather brisk tooday, although no vory important business juas beon reported, Elghteen feet of the Oriental sold for $\$ 550 ; 30$ shares Cedar Hill Tunnel $450 ; 15$ feet of El Dorado, thirty days, $70 ; 10$ feet Birdsall at 17. Some Gold Hill ground cbanged hauds, but the figurea are not reported. Madison is quoted at $\$ 25$, Peach-Faxten at 35, Baltic st 19, Zourve at 8, Hazel Green at 4 50, Geller a 6, Burnaide at 10, Fairvlew at 20 and Sacramento at from 35 to 40 dollars.

## HUMBOLDT STOCK.

Considerablo Aumboldt stock continues in markot, but aside from the Mars, Cuba, Sheba, South Extension of the Sheba, and three or four other claims, there is little or no inquiry in that direction. There is also a large quatity of Eagle and Silver dfonntain district stook, but ent|rely. Fithout buyers.
The following stocks, not enumerated above, are in the market in Virgin

## in City, and held at the figures anuexed :-

At the first meeting of the Esmeralda Stock Board, hold January 2nd. 3863, the following business was transacted in stocks, as roported in the Esmeralda Star
Wiul West-new stock- 25 feet offored at $\$ 400$ : bid 350 on 00 daye Antolope- 50 feet offered at $\$ 150$; bid 125 on 80 days.
Utah-25 feet offered al $\$ 50$; bid 40 on 80 days.

Subscribe.-Are you a miner and not a subscriber to the Maning axd Scientific Press? If so, you are an annual loser of many times the price of a year's subscription, particularly if you are engaged in quartz mining. The same amount of practical information, important to miners and mechanics, which is contained in a volume of the Press, can not be bought from the shelves of any bookstore in the country for the price of several year's subscription. Do you eve send a paper to the "Old Folks at Home?" If so, and you desire to send important information and valuable reading matter, you can find no paper that will be read with so much eagerness by them, or one that will convey to them so full an account of the real industry ol the country as the Mrs ing and Scientific Press. We invite all to send us their names and four dollers, or two dollars for six months, and become patrons of the only mining paper printed on the Pa cific coast. Those who receive a paper with this paragraph marked may understand that it is sent to them for examination, and with the hope that it may so for meet with their approval as to warrant their subscribing for it at once. It is notio our usual custon to receive a subscriber for less than six months; bat inasmuch as we are anxions to introduce the paper where it is not now known, we will, for the present, send the Press for three months even, on the recelpt of one dollar, in coin or stamps. It is our belief that no one will wish to discontue the paper after being a constant reader of it for even that short period.

One Year's Treasure Exports.-The shipments of treasure from San Francisco, during the year just closed, were as follows:
To New York.
.\$26,194,034 93 12,950,139 61

## sUGGESTIUNS ABOUT FOREIGN PATENTS.

American inventors should bear in mind that, as a general ule, any invention which is valuable to the patentee io this country, is worth equally as much in England and some other foreign countries. Fuar patents-A Aerican English, French and Belgian-will secure an inventor exclusive monoply to
his discovery among one hundred millions of the most intellihis discovery among one b
The facilities of business and steam communication are suct, that patents can be obtained abroad almost as easy as at bome. The majority of all patents taken out by Ameri cans in foreiga countries are obtained through the Mining and Screntific Press Patent Agency. Having established agencies at all the principal European seats of Govern ment, we obtain parents in Great Britain, France, Belgium. Prussia, Austria, Spain, ete., with prumptness and dispatch.
Models are not required in any European country, but the utmost care and experience is necessary in the preparation of the specifications and drawiogse
When parties intend to tak out foreign patents, engravings should not be published antil the foreign applications have been made.
Cabtion.- It bas become a somewhat common practice for
agents located in England to send out circulars soliciting the patronage of American inventors. We caution the latter against heading such applications as they may otherwise fall into the hands of irresponsible parties, and thus be defrauded of their rights. It is much better for inventors to entrast their cases to the care of a competent, reliable agent at home.
While it is true of Most Euronean conntries that the system of examination is notso rigid as that practiced in this country, yet it is vastly important that inventors should bave their papers prepared only by the most competent solicitors in order that they may stand the test of a searching legal ex. amination ; as it is a common practice when a patentee finds a purchaser for his invedtion, for the latter to cause such examination to be made before he will except the title.
It is also very unsafe to intrust a valuable iovention to any other than a solicitor of known integrity and ability. Inventors should beware of speculators, whether in the guise of patent agents or patent brokers, as they cannot ordinarily be trusted with valuable inventions.

Our Mint, its Rules, Charges and Operations.
In the columns of a contemporary we observe some ex ceedngly interesting statisties of mint matters for many years past, from which we glean the facts that the legal limit of wastage was $\$ 207,76699$ for the three years ending April, 1857, while the actual loss was $\$ 266,31286$, exceeding the limit some sixty thousand dollars. During the four years of Mr. Hempstead's Superinteudency, the legal limit was $\$ 235,38639$; While the actual lost was only $\$ 4,52035$ being some $\$ 230,000$ less than the limit, and, in fret, a little under two per cent. of the amount allowed by law to be wasted. The wastage of the Philadelphia mint is twenty-
two per cent., against two per cent., wasted by our branch mint. The total expenditures for three years under Messris. Birdsall \& Lott, amounted to the large sum of $\$ 1.019,275$ 39. Under Mr. Hempstead, the total expnoditures los four
years were but $\$ 1,150,64814$; white the difference between years were but $\$ 1,150,64814$; White the difference between
the last year of Judge Lott and the last year of Mr. Hemstead was upward of $\$ 100000$ in faror of the latter. On retiring from the Superintendency, Mr. Hemstead left an unexpended balauce of appropriation due the mint of up
wards of $\$ 86.000$. This certainly is a capital showing for wards of $\$ 86,000$. This certainly is a capital showing for our mint, and speaks well for Mr. Hemspstead's Superin
tendency. Under Mr. Stevens, the present Superintendent, tendency. Under Mr. Stevens, the present Superintendent,
we have no doabt everything wil work in an equally satis factory manner.

$C O R N S$ AND BUNIONS REMOVED
DR. BYRON C. KENNEDY, practical CBIRopodis ate of Philadelphia, ${ }^{\text {w would most respectfally inform the ci }}$ zens of San Francisco that he has opened his office at No. 12 Montgowery street, opposite the Lick House, where he il prepared to remove all excresences, such as Corns, Bunions, Inverted Nails, Enlarged Joints, Swelled Insteps, Frostea, Feet, Chilblains, Callosities, and all diseases of the Feet, without pain or inconvenience to the patient.
Dr. Kennedy also attends to Ganglion, or Scorbutic U8 cers, and all other diseases of the Skin. He may be cons sulted at his office, No. 12 Montgomery street. opposite the Lick House, from 9 to 12 A. M., and 2 to 6 P. M. Haviag deroted six years of study to this important, bat too much neglected, branch of human knowledge, and having studied anatomy under the most skiiful and scientific Professors of Philadelphia, and having made this branch of surgical science my speciaility for nine years, enables me to operate skilully and successfully. In England, Frauce and Austria the highest prizes are often awarded to practitioners in this
branch of surgical science, and it occupies with others an equally lotty position in the profession.
Voizin is an illustrious example, a shining light, among
he philosophical stars of Europe, and Dr. Byron O. Kennedy has fuliy equaled him in this country, as a proof of which he Faculty of the University College of Philadelphia, Pa mplimented him with testimonials.
Dr. Keninedy has bent his earnest attention to the cure of these diseases, in which he has become so great an expert that he is now remarded as the leader in this country, in this brauch of the profession, throughout the United States.
The following letter, which emphatically speaks for itself, of Philadelphia:
Dr. Brron C. Kkxisar: Dear Sir-Lenrntug that you are going to take your departure for california, and wishing to infurm the citizens of telphin and also the people of the State of Californint the esteen of which we hold you, and knowing that notbing is more essental to your
than the eucouragement which Fou may receve from the people of delphin, in the midst of which is the plitground of your boy hoo
knowiag that you bare devnted years of sturly to this important knowiog that you bare devnted years of study to this important but much neglected branch or human knowledge; that you have attained to the
bighest runk in ynur profession, several of the Faculty and other prominent highest rank in your profession, several of the Faculty and other promiwe
citizeus of Philadelphaia having submitted to your manipulation, we cau citizeus of Philadelpha haring submitted to your manipulation, we can
commend you with conffilence to the citizeos of Eun Fradcisco, as one of mast skilful surgeons of the age, and we hope your success may be such an
will repay you for your years of study, and har you may fiod a broad feld or your exertio sin the new and growing city of ibe Pacific.
THE EYES! THE RYES! THE EYESI!!

## DR. E. H. PARDEE,

Oculist and Aurist to the San Francisco Deof, Dumb und Blind Asylum.
After a protracted blindness of more than five years, Dr PARDFE has made himself thoroughly and scientifically acquainted with all diseases of the Eye, and is now practic ing with a success that cannot be surpassed in the United States; and as proof of this he substantiates by many ca-es now in California that have been cured by hina, alter having exhausted the skill of the eminent physicians and oculists o New York city, Boston and Philadelphia.
From an extensive practical knowledge of more than 1 ears, Dr. Pardee asserts, and is prepared to prove, that there has been more blindness from bad and improper treat-1 ment than from disease itself-how can it be otherwise when we take into consideration the effects of the old hacknied course of local treatment that patients undergo-Caustic to-day and Bluestone to-morrow-more painful than death and always more tedious than the disease. Patients are daily presenting themselves with chronic cases, and on inquiring what bad been formerly done, the almost invariable reply is, "I had my eyes burned with canstic or bluestone; I was bled and blistered, theu cupped two or three times week-had a blue pill prescribed for me at night, and salt in the moruing-was ordered in a dark room-to keep my eyes tightly bandaged-to avoid the open air and exercise with fifty other inconsistencies, the aggregate of which sure blindness. Patients should be careful and not place their eyes at the mercies of a man who does nothing but burn them daily, not investigating the circumstances of each particular case, but ignorantly and blindly adopting and fol lowing theories the most erroneous, and destructive to $t$ eye. How much more rational and consistent to consult an experienced Oculist, who thoroughly understands every die ease of this tender organ in all its aspects and varieties. Dr PARDEE has from sixty to one hundred patiects under his daily supervision, and, with but very few cases, they have been treated by other physicians hefore applying to him-and
all to no benefit. Those wio are doubtful are permitted to call at Dr. Pardee's office and confer with the many patients who convene there between the hours of 9 and 12 in the forenoon. The Dr. has a large and only assortment of Arti ficial Eyes on this coast, jnserted, having all the movement of the real eye, and that theylook so life-like that no one c tell them, when properly inserted, frcm the real ere. Thes eyes are sold reasonable.
All the operations performed, such as "Strabismus," cross-eyes-" Cataracts"-or removal of the Lens by absorption or extraction:- "Plerygium," or fleshy membranes growing over the eyes. Artificial Pupils, \&e

## MASON \& HAMLIN.

# Dr, Van Zandt, <br> Consulting Physician and Surgeon, OFFICE: <br> Corner of Washington and Sansome Streets. 

The Great Success of this Century, as an Aid to Practical Medicine.

The Mystetious Problem of Material Nature, Electricity! Made Subservient for the Cure of all Nervous and Spinal Diseases.

THAT THIS PRINCIPLE, succeasfully appliced to discassed statoan by physelastem, is to thid thew mbehicines in overcoming organic, and functiong tality knowr as nervoms lafluence and necesarily must have much to do in obviating diseased action.
In its praise ; for it is highiy probable that in health theere is nn exact equi-
 poise of health se brobeu or lowerud-should the body be negatively esec-
trified when it should be positively charged-is aot the curreut breken, und is there nol a war of forces going ou an tur system 9 This noods correcting, aud 14 order that the tissues of the body should be suscoptible to remedial agents wo must first restore aud

Awaken the Magnetic Life Within Us.
The spinal and sy inpathetic uerve systems. Beleving as I do most firmly upon uar bodies in health and diseuse, I inm lod to take adyantago of the prems, through which to awaken atteution to the subject, that good may
cumo to all.

Give the body strength, aud nature will relieve herself. Purify the life lood, render the stomach, liver, henrt, kidney and all the natural fuacthe nervous, the ulspiritent, the melanchulic, the dyspectic and the invalid revive under ita bengn mfuence.

## To the Ladies of California.

Dr. Van Zandt's success with complaiuts of women, both in family and office practice, is owing to his correot views of tha origin of all their maladies. Ladius cad cousult him with eutire coundence, as he is ao speculator
npon human ills-but is provitig lumself the only member of the legnimate profession in California who is really successiul ul removing those tlls which are the pecular province of the sex. His high uppreciation of their dell-
cately attued nervous organism, logether with their great sympathetie hife, reuders him doubly able to assuage those silent complatulugs which They bear so patiently nal so long. No social disquictude need longer aflict our home circles; for he can arwase tho striciren onergies ; reatore the
wonted louicity of the body ; awakno the melanclolic and deapobdings arwonted louicity of the body; awakno the melanclolic and deapjondings ; ar-
rest those draius which eause so much anxiety; cure those protean maladies whicu have so long
Baffled the Skill of Physiciang.
Develop appetite, life and animation, dispel nervous headache, siuking at
 end lifelessuess, hectic cough, aleeplessness, unpleasaut, drcarns aud that

VOL. VI. SAN FRANCISCO, MONDAY, JANUARY 26, 1863. NO. 13.

MINERAL PRODUCTS OF GREAT BRITAIN.
The statistics of the mineral produce of Great Britain, for the year 1961, are given in detail in a late issue of the Lon don Mining Journal, from which we condmse as follows Ti

Total value of minerals produced in 1851,
The above; it will be observed, is the amount and value of mineral ores produced, exclusive of gold. We give below the amount and value of metals obtained from the ores.

| Tin. | Tons | 7,450 |
| :---: | :---: | :---: |
| Gopper |  | 15,331 |
| Lead. |  | 65,643 |
| Silver | Ounces | 569,030 |
| Zinc. | Tons | 4,415 |
| Iron, Pig |  | 3,712,390 |

$\$ 4,371,656$
7,546,464.
6,937,224.
691.972.

379,784. $44,548,680$.

> Total value of the above
. $866,476,780$.
51,916.
Estimated value of other metals
Estimated value or other metals
Falue of conls- $83,635,214$ tons
1,202,400.

Total value of enetals produced, and coals. . $\$ 168,012,348$.
For the purpose of enabling the reader to readily institute a comparison between the mineral yields of the two coun tries we here append a table of the
mineral products of the united states for 1859,
compiled from the last census Report. It will be seen, on comparison, that the United States produce about two-thirds as much, in mineral value, as Great Britain. We compare the yield of 1859 witb that of 1860 in Great Britain. There is every reason to believe that another decade will place the mineral yield of the United States on a parwith that of England, and all her colonies added. The yield for $1859^{\circ}$ is as follows:-
Gold.
\$47,744,462
610,010
2,000,000
Quicksilve
3,316;516
19,487,790
72,600
977,281
28,176
91,365,765
1,092,450 2,265,302
\$97,659,252
:The production of silver in the United States has largely increased since the census was taken, as the working of the Washoe mines commenced about that time.

The great wealth and power of both nations lies in thei mmense mines of iron and coal. In the former, it will b seen that we as yet produce only three-sevenths of the amount produced by England. Of the latter we produce only one-fifth as much. In the comparative richness, variety and extent of miucral territory and resources, we infinitely excel Great Britain.
We further condense from the London Mining Journa the following

## REMARKS.

Goud.-The returns above given for 1861, contain the first actual report of gold from a British minè. This gold; 2;784 ounces, was obtained from one of the quartz lodes in Dolyelly, Mirionethshire, The natural consequence of this gold discovery has been the formation of several. Companies to work other lodes of a similar character in North Wales, in the progress of which considerable interest is felt among British mining circles.
Snver.-The silver, which appears in the above exhibit is nearly all obtained from the lead produced by the mines within the kingdom.

Copper.-The production of copper for 1861 shows a decrease to the amount of $\$ 683,548$ from the prodret of 1860 . But there was not as much exported in 1861 as there was the previous year. In addition to the amount of $\$ 7,546,464$ in values of copper produced, as per above exhibit, there was smelted of foreign and collonial ores an amount valued at $\$ 7.672,440$.
Tin.-The quantity of tin ore produced in 1861 was some what larger than that of 1860 , but about the same with the yield of 1859. The demand of this metal for the American market is reported as having greatly fallen off during the past year. The export of tin plate to the United States in 1860 was about $\$ 5,000,000$ in value. In 1861 it was only $\$ 2,472.912$. This falling off in the demand for tin led to a very material reduction in its price in the English market.
Lead.-The product of the lead mines of the United Kingdom for 1861 shows an increase or 2118 tons over 1860. Zrnc.-Owing to the low price of this metal during the year, several Zine Mines suspended operations.
Pyrites or Sulphur Ores,--The amount of ores of sul phur produced in 1860 was about 10,000 tons less than the produce of the previous year-which was reported 135,669 tons. The amount of these ores imported during the year 186193,528 tons ; quite an amount of this aggregate was made up of shipments from this State.
Iron.-The Pig-Iron produced was also slightly deprecia ted from the product of 1860. Means are being taken to obtain more accurate results as to the cost of producing ron in the various districts throughout the Kingdum.
Coak:-Much interest seems to be manifested at the rapid waste and exhaustion of English coals. The Report bofore us speaks as follows upon this head:-
The rate of exhaustion which is going on over our coal fields still increases. From 3,052 collieries there was used and sold in $1861,83,635,214$ tons; $2,500,000$ tons were wasted in the process of working, and burnt at surface on the
collieries of Durbam and Northumberland only. The total waste mast, therefore, have been very large, although information thereof could not be correctly obtained.

## RECENT INVENTIONS.

Electric Ligit in Mining.-A French inventor has produced an apprratus for an electric light designed for miners, which is said to be decidedly superior to anything yet introduced and perfectly safe from gas explosions, by means of a proper isolation. The apparatus is convenientand portable, and will burn for twelve hours without dimunition of light. The inventor hopes to still further improve the apparatus in sereral particulars-such as compactness, intensity of illumination, duration, etc.
Gas frox Comyon Acr,-M. Mongruel is the inventor of process for making gas from air, and the gas so produced is exbibited on Aldersgate street, London. The air is conveyed through a tube to a vessel contsining the matter which renders it ignitable, and from thence it passes to the lamp. The light is much clearer than that proceeding from the ordinary gas ; it is represented to be much cheaper, and the inventor announces that explosion is impossible.
Applying Waste Ebat from Core Ovens.-An invention which relates to the mode of atiliving the spare heat of coke ovens, for the purposie of heating air for blast-furnaces, calcining ironstone and ether materials, and for heating and smelting iron, has beenspecified by Mr. J. Harding, of Leeds, Eng. He causes the mouths of a group of coke ovens to open into a flue; which leads directly to the chamber in which the heat is to be employed.
Improvenent in Rolling Iron, \&C.-There is now in course of erection at the Dowlais Iron Works, a self-acting blooming machine for blooming railway iron, etc. It is claimed to be the greatest improvement made since rolling commenced. Mr. Oharles White, of the 'Taff Vale Rail Works, Wales, is the inventor and patentee.
Sewing Machine Mmprotemfnts.-A new sewing machine has been brought out; working two needles at once. It is intended to work on gaiters, boot tops, and other articles réquiring parallel seams: - Another inveation recently brought, before the pubiic is a button-hole-stitcher; which has beein adopted, and the right to use it is purchased by the leading serving machine companies. It holds the cloth steadily while the needle revolves Still another is announced, which in addition to performing all the styles of common plain séwing, will make any requisite description of embroidery, fringe, gimp, ruffling, netting, \&o., at the rate of a yard a minute. The embroidery is said to be especialy beautiful, and superior to the finest Parisian, and all the trimmings are better than can be made by hand, either light or heavy, and of various colors.
Moltiplicity or Patents.-In the official list of "Agricultural Inventions or Discoveries for the year 1861," are 25 bee-hives, 51 cultivators, 26 churns, 70 harvesting implements, 26 corn planters, 41 plows, 45 seeding-machines, and 19 thrashiog-machines.

## MINING NOTABILIA.

The Ophir.-The workmen in the Ophir mine, on Saturday last tapped a ledge-probably the Virginia-from which a stream of water flowed, in such quantity that the pumps were unable to keep it down. Asa consequence the works were stopped, at last accounts, from the water rising in the mine.
Tar total yield of gold from British Columbia up to Jan. 1st, 1863 , as reported by public shippers is $\$ 6,917,146$. These figures do not include the shipments through private hands. The amount so shipped would probably swell the total yield of the Colony since the first discovery of gold there to about $\$ 7,500,000$.

Esmeraids.-The-last Aurora Slar gives a good showing of the mining affairs in the Mono and Esmeralda regions. The "Bodie Bluff Consolidation," the "Julia Elizabeth," on Martinez Hill, and the "Monroe and Thatcher Tunnel," in Willow Gulch, all seem to be prosperous, with rich yields in the present and richer prospects ahead.
The Stock and Exchange Board recently established there meets with some considerable opposition on the part of a portion of the people; but the Star appears to think that it will prove bencficial to the District by driving worth less stocks from the market and enabling those who have really valuable stock to bring the same into notice upon their real merits, with an offic al character and place assigned them in the weekly authenticated reports. Much, no doubt, might be said both for and against the plan of this organization. Reports and transactions of this Board will be found regularly in our columns under its appropriate head.

Gold Mining on the Fresno.-The Mariposa Gazette, of the 13th January, says that the gold veins on the Fresno are paying well, wherever they are worked. Sevaral parties, in lieu of something better for separating the ore, are pounding the rock in mortars and making good wages.

Sale of a Moll.-"Winter's Mill," on Carson River, about two miles above Dajton, has been sold to the Ophir Company who will immediately erect crushing machinery on an extensive scaletcone husdred stamps being named as the probable complement of the mill under its new auspices. The water power is represented to be abundant.

Found tr Agann.-The Vinginia City Union eays that the Enterprise Company, on the hill a short distance west of town, after running their lower tunnel in aboat fifty feet, have again :struck their ledge, which is some four or five feet wide, and appears to be rich; in fact, there are none but rich ledges in that hill.

Minivg in Nevada.-The Nevada Transcript says: "All the ditches at Quaker Hill are full, and the miners in that vicinity have commenced operations. The claims of Jacobs \& Sargent have undergone a thorough overhauling. They are now ready to commence to take out thousands of dollars. Sneath \& Clay on Gold Flat continue to take out cart loads of rock filled with the bright ore. An offer of $\$ 100,000$ was made to one of the parties, a short time since, for one-third, and was refused."

Treasuse Shipment.-The treasure shipment per steamer Golden Age, was as follows :
To England.
\$1,336,894 07
" New York 354,921 29
" Papama. 35,000 00
"Acapulco. $5,000 \quad 00$

## Total.

. \$1,731,815 36
Corn for Fuel.-The Delzell steam mills at Alanta, Ilinois, are now running with corn for fuel instead of wood, that article being cheaper and more easily obtained than either wood or coal.

Pond's Ňew Quartz Mal.-This mill has been completed, and its first trial on Wednesday last, at the Miners' Foundry, which was made in the presence of a large number of experienced mill men, was pronounced a complete success. We defer any description of it until the engravings designed for its illustration in our columns are ready. We had expected them in season for the present issue, but have been disappointed.

## PROGRESS OF THE COPPER INTEREST.

The copper excitement appeears to be on the increase important derelopments are constantly being made in al most every direction. We have gathered up the following tems since our last issue :-
In Nevada county the Transcripl learns from "reliable authority that during the past four weeks upward of twenty valuable discoveries of gold and copper have been made in and aronnd that city. There are at least one hundred men prospecting for new diggings within two or three miles of the place. A new lead has been discovered about fifteen miles from the city, and a company of one hundred men has been formed for the purpose of working it.
The Democrat states that Mr. R. S. Whigham, formerly of Nevada, but now a resident of the Southern part of the State, was in that city looking after a copper mine which he discovered in 1852, and which assayed 30 per cent. He did not consider it of any value then.
A correspondent of the Daily Herald, writes to that paper a highly encouraging account of the progress of the newly discovered mines of copper in the neighborhood of Crescent City, Del Norte county, from which we condense as follows:-
 rived in this city a few days since. The ore is of the variety known as the Red oxide of copper. This ore when found in large quantities, which is not often the case, is considered a very valuable ore. This shipment can be seen at the office of Messrs. Shiel \& Price, 616, Market street. The portion of the vein from which it was taken is $21 / 2$ feet wide, eight feet from the surface. The prospects of this mine are highly flattering.
The Mampoth Company will send forward a shipment by the next steamer. This company has "struck it rich" in their tunnel, 70 feet below the surface. The vein is about two feet thich, and the ore, says the Herald's correspondent, "has the appearance of a rich bronze"-which would lead to the inference that it consists of "copper pyrites." This variety of ore, when it assumes a "rich bronze" appearance is usually very rich; when it appears of a paler hue it is of a poorer quality, the change in color being due to iron pyrites which are valueless in this connection.
Tue Alta Company have a vein six feet wide, and fine ore. Eight men are at work getting out the ore and opening up the mine. They have now 150 tons of ore on the surface, and will have a large quantity ready for shipment early in the spring,
A new and rich copper mine has been struck near Gasquet's, Smith's River, from which excellent ore is being taken.
In Rockland District, thirty miles trom Crescent City, a new mine called the "Cruikshank" has been located and the Company incorporated. Some splendid specimens of ore have been taken from it.
The "Express Company" is running a tumel 150 feet to strike a vein which is in sight on the surface. A box of ore from this mine came down on the steamer.
A new mine has been discovered in the southern part of Del Norte county from which a large amount of native copper has been taken.
If a smelting furnace should be erected here next spring it would pay well. Such an institution is needed. There are now on the surface hundreds of tons of ore ready for use, and thousands more are coming.
In Calaveras county, there appears to be no dimunition of the copper excitement. As a necessary consequence of realy valuable discoveries, the lawyers have already got some of the proprietors in this county at loggerheads, avd a suit has been commenced in relation to the ownership of the Copper Hill Mining Co's claim, near Campo Seco. A large number of witnesses have been summoned in the case, on both sides.
In Amador county, considerable excitement exists in and about Jackson, in consequence of new discoveries recently having been made near the Mountain Spring House. The Amador Dispatch says that Dr. Newton recently refused $\$ 6,000$ for his interest in one of the newly opened claims in this vicinity.
El Dorado.-There is great excitement about Clarksville, in El Dorado county, on the Folsom and Placerville road
as rich croppings of copper have been discovered within the past week. Men from Copperopolis, owners of rich copper claims there, have come over and located claims, and now have men prospecting on them. The new comers express the opinion that the croppings are very promising.

Copper Shipments.-The Clipper Ship, Fying Eagle, has been chartered to load with copper ore for Boston. Sixty tons of ore from Newton, Amador county, were placed on board ship Peruvian, a few days since, for Swansea. This shipment was made by Mr. Sheil.

## THE REESE RIVER MINES.

This new mining region, which is just now attracting much attention is located on the Overland Mail and Telegraph Route, about 70 miles South-easterly from Humboldt, and 130 miles from Carson City. The Reese River is one of the numerous class of rivers in that region which fall into a common sink with the Humboldt. Dr. Veatce, an eminent metallurgist, well known in this city, gives it as his opinion that this is one of the richest mineral regions yet discovered.
We have been favored with the perusal of a letter recently received from that region from which we learn that the mines are being rapidly developed. The ledges, so far as assays can prove them, give indications of great richness. We dare not give the figures which are before us, although they come from sources entitled to the highest credit. The principal ledges opened thus far appear to be the "Oregon," "North Star," "Lander," the "Comet," "Highland Mary," and "Pony Ledge."
The tunnel on the Pony Ledge has been dyiven 180 feet. That of the Highland Mary is in 61 feet. The Comet Company are at work on their ledge and taking.out what is apparently very rich rock. The Oregon and North Star are being worked with vigor. Rock from the former has been assayed and pronounced by Dr. Veatce, richer than any other yet discovered on the Pacific Slope. The Dr. is daily expected in this city, when we hope to be placed in possession of further facts, with regard to this interesting mineral region.
The Reese River Mining Company, which is interested in fourteen different Ledges, will erect a mill here early in the Spring. The Company have plenty of wood and a good Water Privilege. This is the Company which is running the tun. nel into the "Higbland Mary. It is made up chiefly of San Francisco Capitalists, who have the money to put it through.

Mr. F. W Cassmul, who is soliciting for the Mining and Scientific Prese, in some of the lower mining counties writes us that the new silver and copper discoveries in the neighborhod of Mokelamne Eill have created much excitement in that vicinity.. . Mining operations are rather dull in the districts which he has visited, just at the present, but better times are anticipated soon. We trust our mining friends will cheerfully respond to the calle of Mr. Cassell, and allow their names to be enrolled as subscribers to the Peess.

Injunction Surt.-The Yellow Jacket Company of Gold Hill Dist., Washoe, have sommenced suit against G. A. Hart and others and enjoined them from working and removing ore from their claim. The plaintiffs claim twelve hundred feet of ground, and aver that the defendants have jumped and removed from a portion thereof much valuable ore, and otherwise damaged their claim, for which they ask $\$ 10,000$ damages.

Washoe Ironworks.-Three foundriesand machine shops and one boiler manufactory are in full blast in this Territory, turning out in the aggregate no insignificant amount of machinery.
San Francisco Stock Exchange.-The following gentlemen have been elected officers for this association for the ensuing year:-J. B. E. Cavillier, President; J. Perry, Jr. Vice President; Franklin Lawton, Secretary; Henry Schmiedel, Treasurer.
Shot Proof Ships.-Within the last three years 590 plans for the construction of shot proof vessels have been sabmitted to the British Board of Admirality.

## SAN ERANCISCO MINING NOTICES.

Burning Moscow.-Shares of this Company, in arrears for axdessments will be suld at auction, Feb. 9.
Baltimury Awerica C'onsolidated-An assessment of 50 cents per thare was levied, Jan. 5.

Siavure,-An assessment of \$35 cents per share was leviod, Jun. 7.
Ilawley.-An assessment of 25 cts. per share was levied Jan. 5 , payable in 30 dalys.
Cole S. M. Cu.-An assessment of One Dollar per share was levied, Jan. 10, payable, Feb. 1.
United States M. Co--duassessment of six and twothirds cts. per share was levied Jan. 10, 1863, payable to the Superintendent at the mine, or to the Secretary, Rooms 7 and 8 , Government House, San Francisco.
Sierra Novada S . M. Co. levied an assessment of $\$ 15$ per share, Jan. 15-payable Feb. 18.

Larly Bryan.-An assessment of 70 cts. was levied, Jan. 13, payable on or before Feb. 16.
Ida G. \& S. Co. (Russ District)-An assessment of $\$ 1$ was levied, Jan. 14.

Henry Martin f. \& S. M. Co.- "Thomas Wallace, Trustee." gives nutice that wherens certain parties illegally claiming to be Trustees of this Company, have changed the name of the Corporation to the North Stur G. \& S. M. Co., and illegally elected officers for the same, the public are cautioned against such acts, etc.
Red, White and Blue G. \& S. M. Co. levied an assessment of 25 c 'nts per share, payable on or before Feb. 1st office cor. Pine and Montgomery Sts.

An assessment of $\$ 35$ per share was levied Jan 6, payable immediately, at office, No. 712 Montgomery street.

Iona Copper Mining Company.-The annual meeting of Stockholders for the election of offleers, will be held, Jan 23, at office, No. 502, Montgomery street.

Live Oak Copper Co-The Annual Meeting of Stockholders for election of Trustees, will be held at Office, in Montgomery Block, Feb. $2,1863$.

Coso Silver Mining Co.-The Office of this Company has been removed from the Stevenson House to Nos. 11 and 13 Court Block, No. 636 Clay street between Montgomery and Kearny. Entrance on both Clay and Merchant streets.
Mina Prieta S. M. Co.-An assessment of $\$ 10$ per share
was levied, Dec. 26, 1862-payable at office, cor. Montgomery and Jackson Sts., on or before Jan. 26, 1863.
Savage Mining 00 :-The Annual Meeting of the Stockholders of this Co. will be held at Office, 712, Montgomery St. Jan. 13.
Union G. \& S. M. Co.-The regular quarterly Meeting will be held, at Office, 410, Montgomery St., Jan. 19.

The Madison G. \& S. M. Oo. advertise names of parties who are in arreas for assessments, and give notice that their stock will be sold on the 29th day of Jan. unless said assessments are previously paid.

Franco-Americano S. M. Co.-The following persons were elected officers at the meeting of trnstees, Dec. 26 thChas. F. Gaian, President and A. S. Gould, Secretary.
The office of this Company has been removed to No. 528, Clay street, Room No. 2.

Central Silver Mining Co.-The Annual Meeting for the election of Trustees will be held Jaa. 13, at Office, No. 712, Montgomery street.

Lady Bryan G. \& S. M. Co,-Shares of delinquent stockholders will be sold at auction for assersments, at No. 400 , Montgomery steet, on Jan. 27 .

Desert Mining Co.-Shares of Ielinquent stockholders will be sold at anction, for assessments, at No. 400, Montgomery street, Jan. 27.

Wide West Mining Co.-The Secretary of this Company publishes an important notice to Stackholders, in the daily papers.

Reese River Mining Co.-Ten cents per share has been levied upon the capital Stack of this Company, payable Jan. 14th.
San Francisco S. M. Co. have laid an assessment of $\$ 25$ per share, payable on or before Jan. lst, 1863.
Pacific Quicksilver Mining Co.-Assessment No. 3, of \$1 per share was levied, Dec. 22, payable immediately.
Keystnne Copper Mining Co, advertise for preposals to purchase or treat 3d quality copper ore. Proposals received till Jan. 15th.
Mammoth Ledge Mining Co. give notice of an assessment levied and payable on or before Jan. 13th. Also that the first annual Meeting for the election of Trustees will be held at office, Jan. 17 th.

Hale \& Norcross S. M. Co. have leried an assessment of $\$ 5$ per share payable on or before Jau. 26 th.

Meredith Gold \& Siluer Minisg Co.-An assessment of two and a half dullars per share (five dullare per foot) was levind by this Company. Dec. Ilth, payable immediatey , at office, 712 Montromery st.
Buition G. \&S. M. Co.-The Stockholders are notified that they will hear something to their advantage by cal ince at the ollice of the Company, cor. Pine and Montgomery sts.
Emmett G. \& S. M. Co.-An assessment of twenty-five cents per share was levied, Nov., 2lot aud is now due, and payable at office 326 Clay St.
Vibbarn G. \& S. M. Co.-An assessment of 25 cents per share was levied, Nov. 2lst, and is now due at office 326 Clay St.
Doyle G.\& S. M. Co.-Ans aseessment of 25 cents per share was levied, Nov. 21st, and is now due at office No. 326 Clay St.

Canrles Cany Mining Co.-An assesment of $\$ 150$ per share was levied on the stock of this Company, Dee. 14th, $186{ }^{2} 2$, payable on or before January 14th, 1803, at office, 338 Mantgemery St.
Live Oak Copper Mining Co-Office, Montgomery Block -Au assessment of thirty ceuts per share was levied, Dec. 1st, 1862 , payable in thirty days.
North Potosi Sllver Mining Co.-An aseessment of four dollars per share was levied on this Company, Dec. 11, 1862, payable on or before January 16th, 1863, at olfice, Cor. Battery \& Washington Sts.
Iowa Mining Co.-An assessment of Four Dollars per share was levied, Dec. 4th, payable at office 522 Montgomery St. on, or before Jan. 3d, 1863.
Josephine Mining Co.-An assessment of two dollars per share was levied, Nov. 19 th, and is now due and payable at office No. 21 Stephenson House.
Burnside S. M. Co. - An assessment of one dollar per share was levied, Nov. 17 th, payable within 30 days, at office 712 Montgomery St.
Hawley Mining Co:-An assessment of 50 cents per share was levied, Nov. 15th, payable at once, at office 204 Front St.
Amertcan Quicksmiter Mining Co.-An assessment of one dollar per share was levied, Dec. 16th, payable at Company's Office, in Petaluma, within 30 days-At the expiration of which time delinquent Stock will be sold.
Burning Moscow S. M. Co.-An assessment of Two Dollars per share was levied, Nov. 25, for the parpose of detraying expenses of steam pump and machinery now being erected to drain the mine. Prompt payment is requested at the Company's office, corner of Mon'gomery and Jackson Sts., to Jos. P. Nourse, Sec.

## WASHOE MINING NOTICES.

Martin White-An assessment of 20 cts. a share was evied, Jan. 2.
Oriental G. \& S. M. Co.-An assessment of 50 cts. per share was levied. Jan. 14. payable at Office, cor. Sutton Avenue aud C St., Virginia Citg.
Normon S. M. Oo.-Middleton \& Sons, No. 40, Montgomery Block, will sell delinquent stock of this Company, February 16 th.
Baltic Mining Co.-Notice is given of an adjourned sale of shares in this Company, to take place on the ground, Jan. 3lst.
Progress G. \& S. M. Co.-An assessment of 20 cents per foot was levied, Dec. 27, 1862, payable forthwith.
Sweesy Co.-Washington Ledge.-An assessment of $\$ 10,000$. being $\$ 53 / 2$ per fuot-was levied on the stock of this Comyany, Dec. 28, payable at the Secretary's Office. Medan Building.
Miners' Meeting.-At a meeting of the shareholders of the Siegel Mining Compauy, it was resolved that a meeting be called of all the miners of the Siegel Mining District, for the purpose of making laws by which said District may be governed, and that said meeting shall take place on the 15 th day of January, 1862, in said Siegel District, in or
near a certain place better designated as the Siegel Min. near a certain place be
ing Company's Cabin.
Caution.-D. M. Tyrell warns persons against purchasing a certain 10 feet of ground in the Wellington Co., standing in the name of J. B. Magee-also 20 feet, stauding in name of W. Williams. (See Territorial Enterprise.)

Ashland Co.-L. A. Gould, in the name of the Moss Co. notifies the Ashland Co. that their westerly drift has cut the Lamb ledge, in the Moss Co.'s ground, from which the Ashland Co. is forbidden to extract any valuable metals.
Eldorado G. \& S. M. Co.-An assessment of one dollar per share was levied, Ded. 31, 1862 , payable, Jan. 22, 1863, to the Secrelary, at corner of Montgomery and California streets, or to the Superintendent at Virginia City.
La-Plata Oro Co.-Gold Hill District.-An assessment of two dullars per share was levied, Dec. 26, payable at once,
at Office of the Secretary, Court-house Building, Virginia
'ity. 'ity.
Texas Co.-Tennessee Ledge.-An assessment of $25^{-} \mathrm{cts}$ : per foot was leviod, Dec. 22, payable on or before Jan. 21, 1863.

The Regular meeeting of the Company for election of offerers, will le held at the Conet Saluon, Virginia City, on Saturday, Jau. 21.
The North American Co., Gold Hill, will sell at auction Jan. 31, stock of shareholders deliugueut in payment of sesaments.
Martin White Mining Company.-An assessment of ten oents per foot has been levied, payable to the Secretary, at cflicc on C Street, Virginia City,

The Sweeney Co., Gold Hill, give notice that Baltic Company have wrougfuly claimed and worked their ground since July, 1860.
Poorman G. \& S. M. Co--An assesement of Five Dollars per share was levied, Nov. 9th, and another of Ten Dollare per share, Nov. 21, payable at once to the Secretary, R. J. Mitchel.
Coledonta Turnel and Mining Co.-An assesement of Thirty-two Dollars per share was levied, Dec. 8th, payable immediately to the Secrelary, Martin White.
The Uhimex Rock Co., lying next west of the Virginia Co. claims have notifed the Ilazel Green, Tingley and Biach \& Paxton Companys that they are tresspassing upon the Chimney Rock Co's ground.
La Crosse Minina Co.-An assessment of $\$ 125$ per share was levied, Dec. 8th, payable at office 730 Street, Virginia City.
Hapk Eye Silver Mining Co:-An assessment of 25 cents per foot was levied, Dec. 6th, payable immediately to S. A. Kellogg, Sec. Gold Hill.

Mogegan Co, Cedar Hill-An assessment of fifty cents per foot was levied, Dec. 5th, payable forthwith, to the Secretary at Virginia City.

Oriental G. \& S. M. Co.-The 3 d assessment of 15 cents per foot, was levied, Dec. 8th, and is payable at office, No. 31, C Street, Virginia City.

## ESMERALDA MINING NOTICES.

The Zenobia Lode Company, give notice that they claim a superior title to the Jobnson Co., claiming the same ground, so far as said localities couflict. This ground is a portion of that now held by the Company known as the Wide West Company. The notice is signed by A. Waddell, J. C. Dorsey. S. P. Dorsey and James Elder,

## MINING AND SCIENTIFIC PRESS.

THE ONLY MINIVG, MECHANICL AND SCIENTIFIC PAPER ON THIS CONTINENT.

## THIRD GEAR: VOI,OME VI.-NEW SERIES!

186
new volume of this extensively circulated paper commenced Sept. 11, 1862. It is intended that every number shall be replete wits information
concerning Mining, scientific, Mechanical and Industrial pursuits, together with several original engravings, of new inventions, etc., prepared exprossly for its columus.
This paper is de
This paper is devoted to the above purposoy, together with tbe interests of Science, Arts, Agricultare and Commerce, and any general information
that may be of interest to the reader ; and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and valuable information to any paper yet published.

The Mining Interest /
Will find it of great value, as it will contain all the nows appertainfing to Mining, the prices and sales of Mining Stocks, bew inventions of Machinery adaped to toa
to the Miner.

## The Inventor !

Will Gind it an excellent medum for the purpose of bringing his invention into notice, of astertainige the progress of invention in this and other
countries, and also of receiving any information that may bo necesary countries, ang his patent, the preprietor baving had great experience as a
in obting
Patent Agent, together witb facilities at Washington that enable him to ob in Patonts with disparch.

## The Mechanic and Manufacturer !

Will be greatly benefitted by its perusal, as each number will contain several original engravings of new machines and inventions, together with a large amount of reading matter appertaining thereto. We are constantly
receiving the best scientific jourals from anl quarters, from which we receiving the best scientific journals from all quartera, from which we
shall continue to extract whatever may bo of beucfit or interest to our readors.
To Chemists, Architects, Millwrights and Farmers! This journal will be invaluahle. All new discoveries in Chemistry will be iven, and a large amount of informalion of great, service to Architects and
Sillwrights will be found in our columns. The Farmers and Planters will not be neglected, engravings will be given of agricultural implements, and tho farming interest generally will be amply discussed.

## Terims.

To mail subscribers:-Four Dollars per annum.
Club Rates.
Five Copies for Six Months, S8.
Ten Copies for Six Months, \$16.
Ten Copies for Twelve Moriths, $\$ 30$.
Fifteen Copies for Twelve Months, $\$ 44$.
For all clubs of Twenty and over, the yearly subscription is onily $\$ 280$ For all clubs of Twenty and over, the yeariy subscription is oniy $\$ 280$ Specimen copies will be scnt gratis to any part of the country.

## To Printers.

An Interest in one of the most flourshing and best paying Newspa per Offices in the monutains is offered for sele on easy terms. A rare op ortunity is hereby presented to any priuter devirous of establishing him self in a good business in one of the healthiest, most thriving and delight ful mountain towns it the state. For further information enquire at thi office.

## DISTRIBUTION OF GOLD AND SILVER.

The most productive quartz ledges or lodes, generally, are those which are the narrowest. There is a lode of tin in Cornwall, Eng. only three inches in thickness, which is very valuable; in the same vicinity there is a copper lode only six inches thick, which is more profitable than oue twenty feet thick in the same hill. The famous Copper Falls vein at Lake Superior is but 8 inches thick, and the Oliff mine 12. The richest veins in this State are generally very narrow, rarely exceeding an average of 12 or 15 inches. There are many very large veins in the State, some averaging as high as 10 , and even 15 and 20 feet in thickness. Were this class of veins to pay as much to the ton as the smaller ones do, the profits on them would be so enormous as in a short time to so augment the product of gold as to seriously affect its comparative value.
Gold and silver form the chief basis of the circulating medium, and Providence seems to have so ordered their distribution throughout the globe, as to require about the same anount of labor for production, in one place as another. Were it otherwise, incalculable mischief would result to the monetary affairs of the world.
Gold is the most universally and evenly diffused of all metals known to to man. Its supply must have been purposely ordered for the very object for which it is principally used. Those portions of the earth which were first peopled by man contain but limited supplies. The wants of man in those days did not require a large supply. Commerce was scarcely known, and the little that was carried on was chiefly in barter which did not require a large circulating medium. As man increased on the earth, and as artifcial wants grew up, commerce was called into bring to supply those wants. A material for a circulating medium was needed, and it was found in the distant regions whither the new conditions of sonciety led man in his travels and enterprise. The ancient Ophir, wherever it may have been, furnished the material, which was called for by the sudden rise of commerce in the days of Phcenician glory.
Phericia went down, and with it the commercial enterprise of the period. The wars and conquests which destroyed the peaceful and elevating pursuits of those days were succeeded by the dark ages. When the light of civilization again began to dawn, Columbus introduced to the world another Ophir, in the central portions of the Ameri can continent, from which the increased demands of commerce were once more supplied.
Years and centuries rolled on, and the nations had again become in a measure torpid. With the dawn of the present century, a new commercial era was introduced. The Arts, Sciences and Commeice were advancing with rapid strides, and men began to be in want of another increase to the circulating medium. The first resort was to an imaginary basis. The commercial world were relying upon a paper medium from the sheer necessity of the case. The activity of the times pushed a few pioneers of the "progressive race" to the western shores of our continent; and here, in the mountains of California, was again found the needed supply
which the wants of the age so imperiously demanded. The false basis which neeessity had so recently created began gradually to disappear and its place to be supplied by a legiti mate substitute.
Thus the means seem to be most wonderfully adapted to the end. From the earliest di-covery of this universal medum, it has been found in almost precisely the same conditions. About the same amount of labor is required to produce it now as at its first introduction into commerce, and it occurs in about the same quannities both in its ores and in its placers. May we not see in all this the hand of Providence adapting the means to the end? It is idle to talk of monetary derangements growing out of the increased supply of gold. Gold is the great agent which God has furnished man, wherewith to meet the necessities of the race in supplying the artificial wants to which he is now, and will continue to be, more and more subject in his onward progress to social perfection. It will ever be found exactly adapted to the ead. God's works and laws are always perfect.

## BRITISH MINES.

In another column we have given the total yield of the mines of Great Britain for the year 1861. On carefully analyzing these figures we arrive at the following facts with regard to the average richness of the mines of tiat country and the cost of extracting the mineral from several of their ores :-
Trv.-The average yield of the tin ore for 1861 was $\$ 375$ per ton. The cost of reducing the same appears to have been $\$ 76.36$ per ton; but we are inclined to think there must have been a discrepancy between the number of tons produced and the number worked which makes the cost of working appear much larger than it really is.
Copper.-The average yield of copper ore was $\$ 3260$ per ton.
Lead.-The yield of lead ore was $\$ 7648$; the cre berag reduced at an expense of $\$ 1634$ to the ton.
Su.ver.-Ouly 29 tons of silver ore were raised, which yielded an average of $\$ 243$, 44 to the ton. We do not learn from what locality this ore was obtained, nor have we the data from which to calculate the cost of its extraction from the ore.
Zinc.-The yield of ziuc ore was $\$ 24$ to the ton, which was worked at an expense of $\$ 1461$ to the ton.
The Yield.-Gov. Pickering estimates yield of the Washington Territory, gold mines for the last year [1862] at from $\$ 8,000,000$ to $\$ 10,000,000$.
It is from such mistaken and reckless "estimates" as the above that the Land Commissioner founded his estimates, for the immense revenue which he told the country, in his late report,,might be derived from the mines of the Pacific Coast. Instead of Washington Territory yielding eight or ten millions of dollars the past year, the entire North Coast, including all British Columbia, scarcely yielded the half of that amount. We append the figures, derived from facts not estimates :-
The total amount of treasure received in San Francisco from the entire North Coast daring the year 1862, as derived from official sources, was $\$ 4,931,579$. The amount shipped from the Port of Victoria to San Francisco by Wells, Fargo and other public shippers was $\$ 2,167,188$; thas leaving a balance of only $\$ 2,764386$ as the yield of Washington Territory and Oregon. The amount forwarded by private hands would scarcely increase that sum to $\$ 3,000,000$-or one third the amount estimated by Governar Pickering. Statistics to be valuable should be correct. We can see no good to be derived from an over estimate of our treasure products ; facts are what the people want, and all they need -more than that is fraught only with mischief.
Singular Development.-The Territorial Enterprise in its Stock Remarks of Monday last says that several Companies in Gold Hill have struck very rich rock by drifting to the Eastward, at what depth is not stated. Where this rock is struck, the ledge is found pitching to the East. This ledge, it will be reeollected, has hertofore been found pitching to the West. It is possible that the miners have just reached the true vein ; at all events claims bave considerably advanced in the ostimation of the present holders, and higher rates are asked than prior to the discovery.

## SAVING SILVER AND GOLD.

It is generally conceded that a large loss of mineral occurs in working gold or silver ores in the slum, or muddy water drained off from the vats which receive the sands from the batteries.
O. W. Easton, of Virginia City, a gentleman of much experience ia reference to this loss, makes the folluwing suggestions in the Virginia City Union:-
We all know that in the working of gold ores in California by stamping and grinding, the quicksilyer is knocked and ground into spray-sil ver, so called. Such is to a great extent the condition of a large portion of quicksilvr; whether used in the pans with the pulps, or in the barrels in the Frieberg process. Thus fine silver, which is not collected, carries off the small portion of metal liberated from the rich Comstock as well as other ores; and a simple mechanical means whereby the silver spray and fine amalgant could be savied; is the grand desideratum I propose that the tailings should be riddled by passing then through copper wire cluth sieves, which have first been tlectro-plated. The pulp and all the water, with clear water added to liquify the mass thoroughly, should be run over and through a succession of these sieves, the effect of which would probably be to pick out from the mass-by the affinity of the metalic silver on the wire for the silver in the pulp whether as spray, quicksilver or fine amalgam-all the metal now lost. As collected it would fall in globules with the tai'ings to be saved by quicksilver in riffes placeul in the sluice boxes, it having collected in particles large enough to have an appreciable speoific gravity. The tailings can be repentedly riddled as they run, without any labor or attention. The mass must be distributed very thin. Experiment must determine the size of the meshes of the wire cloth. The tailinge can be distributed by buttons as in the German sweep tables.
The above is a most excellent and practical suggestion, and could scarcely fail to prove remanerative.
The "wire cloth sieves" to be used for the above purpose, should be "electro-plated" with gold-silver, however, might possibly answer. If sieves of copper or brass wire were used, the abrasion of the sauds and the penetrative character of the quicksilver would soon destroy the wire.
In addition to the above we would suggest another plan, which we believe has in part been adopted by some mills.
Instead of the shoal vat in general use let a. deeper one be constructed, even if it be of smaller superfices, and immediately over this vat construct an apparatus of the same sapericial measurement from which-a constant shower bath (a very light one will answer) of cold water may be discharged upon the slum. This cold water, shower has an almost instantaneous effect upon the "spray-silver," so called, collecting and condensing the same into globules which readily settle, and thus, with the gold and silver which they contain, become fixed in the sands at the bottom of the vat. Every mill Superintendent is aware that by pearly or quite all the processes ordinarily employed, a large amount of quicksilver is lost, the loss from retorting accounting for but a small portion thereof. This quicksilver thus lost, mostly passes off in the condition alluded to by Mr. Easton; and "that's what's the matter," or the reason, in a large majority of cases, why the rock don't pay. When triturating pans are used, through which a flow of water is allowed for some time previous to the final "clean up," the loss from this source is very large. "The employment of the shower bathover the Fats, the placing a series of wire sieves, in addition, as suggested by Mr. Easton, and the use of Wheeler" "Separator" -a machine illustrated in the Press of January 12th-for cleaning up, will, we believe, render valuable a large class of veins now deemed entirely unproductive. The two former appliances are exceediagly cheap and simple; and the show er bath will require but a little water. It need not fall much faster than it does in a pretty smart summer shower. The "Separator" is not an expensive machine, and we would advise every quartz miner, visiting the city to call at the Miners' Fonndry and see the machine at work.
Every month and almost every day our miners leapo something new, and each access of experience, or practical suggestion, made public, adds to the general fund of knowledge and the aggregate yield of our mines. The object of this journal is to establish a general medium of communication among miners, by which information of this character may be speedily and conveniently disseminated among those interested ; and it will at all times afford us pleasure to lay before our readers any new ideas or practical. suggestions which may for from time to time come up among those engaged in the difficult and intricate art of separating gold and silver frum their ores, or mining for those ores in the bowels of the earth.

GENERAL MINING STOCK REPORT.
REPORT UF SALES
At the San Franoluco Mining stock Board, Fior the nevk eadaug Jafiluary 24, 18 titi.

## Coso Stocks.

The Josephine changed hands at the Stock Board, ou Monday at \$16, on Tuestay at 16; on Wednesdey 16, on Thureday at 16, on Fridey at 25. m Coso-changed batds on Thursday at 10 dullara.
Willow Syringemaid on Tuesany at $\$ 20$.

## Mexican Mines.

Wina Prieta inda no recent buyers, but is bold at $\$ 140$. Dius Padre was quoted on Tuesday and Thurdsy at $\$ 33$, on Friday at 30.

## SAn Francisco, Jan. 26th, 1863.

## stoct remarks.

The miniog stock transactions of the past week have been uousually large, and probably embrace a wider range of atocks than has ever before boull uoticer in the market. We quote for tbe week, sales in 33 different
companos ; mostly at prices which show a decided imptovement over acy atmalar period, These facts augur well for the favorable progress of our miving interest, and indicate such a tone of coufidence smong our ow capitalists who scek high percentages, as cavoot rail to operate most faverably In attracting hither foreigu capital, which is satisfed with much lower percentages whenever safo investments are offered.
The peculiar seuaitiveness of Ophir stock has again been most remarka bly manifested. We quote iu a range from $\$ 1600$ to $\$ 26501$ It sold early on Monday at $\$ 2600$ and on Wednesday was quoted at the Stock Board at $\$ 1600$-a decline of $\$ 1050$ in three days! The osteusible reason of the de chne was one which, in the mind of an experienced miner, would not afect the alock to the value of two per cent.
Gould \& Curry still contivues in demand at anvanced rates. The advance is attributable
the quantity offered. Speculation iu the January, dividends is atill indulged in. Dividends to the foot, monthly for one year were sold for $\$ 80$ on Friday, aud $\$ 90$ was offered on Saturduy, $\$ 92 / 2 / 2$ was freely offered for the Jouuary dividend.
Savage is still advancing ; sharen having gone up $\$ 250$ during the week Their advance to 320 s 0 om 60 days is confidently predicted.
Cbollar and Potosi romain at about last quutationie, with a very slight advance. Buyers will probably hold shy of both until the result of the pending suit is announced.
Norton, which was in demand, a week ago, at greatly advanced rates has uot sustained itself during the past week; buyers are waiting further develnpments with regard to the "rich strike."
Daney has advapced $\$ 40$ per foot over last quotations. Still forthor adwancesin this stock may be looked for, as it will soon become a dividend paying instituthon. The company's mill is nearly ready to start, and a large supply of good ore awaits its completion.

## ESMERALDA STOCKR.

Considerable confidence is begining to be manifeated in Esmeralda stocks which are able to pass the ordeal of the "Esmeralda Board." While that inatitution, as now managed, will doubtles exert a benefcial infuence on legitimate stock operations, it cannot be otherwise than detrimental to the development of new mines. It is advantageous for San Francisco but the reverse for Esmeralde.
Wide West has declined a Iittle in consequence of the jojunction of the Dimes Company. Holders should not be alarmed as that suit will scarcely reach the diguity of "a tempeat in a tea-pot" affair

## TRANSACTIONS OF THE WEXK.

240 feet of Bamboo sold at $\$ 40$ per foot.
65 shares sitruwberry suld at $\$ 10$ per sharo
100 feet Ciriden Age at $\$ 5$ per foot.
25 stares leru, at $\$ 5$ each.
20 feet Bodie Bluff Cousolldation, at 312.
Application for Examination and Clussification was recelved from the folowiog Companies:-Garibaldi, Ural and Julla Elizabeth
J. B. BLANCBARD, Socrolary.

## WASHOE STOCK REPORT,

[Couplibd prox tue Dasly Tkrbrtorlal Eaterpuask]]
Monday, Jan 12.-The Flowery Hill Company, Summit District, it is sald afford iadicatlens of a guod ledge. The work of prospocting is boing diligently prosecuted, und many outisiders are wateling the result with miuch interest, as indicative of what may be expected from otber miven in the digtriet. The Hale \& Noreross Cumpruy have placed their mine in good condition for working, and, at last accounts, were about ready to commonce taking out rook. Therr hoisting muchinery is driveu by a 15 -horse power engme. The Pride of Washoo Company have started a cuunel to strike their ledge at a dupth of 75 or 100 feet. Their ledge is about 17 foet in width at the surface, aud proapects well in both gold and silver.
The stock operations. for to-day bavo beod limited and unimportant, tho' much onquiry has been mado for claime at figures alightly below the prices asked. Two lots of fifteen uvd tou fout each in the Wellington Company sold at rates not desired to be made public. Fifleen feet of Braball sold at $\$ 16$. Twenty-five feet of Walker \& Co. sold at low rates.
Tuesday, Jan. 13.-The La Crosse Company bave entered into two severs contracts with reepoasible parties for the raisiug of $\$ 000$ tous of ore, the contractors furnishing their own engiue and other machinery. Transactiona in stocks have been light to-day. Two sales, of 6 and 10 feet in the La Crosse are reported at an advauce on last quotations. Tho development of a suit botween the Yellow Jacketand the Union and Laboring Companies at Gold Hill, has thrown somestock in all these companes into the marbet at reduced figures, but the demand is almoat equal to the supply. Twelve feet of Birdsali sold at $\$ 17$, and 6 feet at $\$ 1750$; eight feot of Allen at 45 ; 10 feet Fairyiew at 20. 25 foet Gay, at 350.
Wednesday, Jan. 14.-Transactions light, to-day. The high rates of arst clase atocks in San Francisco have caused a general firmness, and good ground was spariogly offered. Baltic was quoted to-day at $17 \%$ and Zouave at 8 dollars per fout. Prices remain aubstantially as yesterduy and the day before.
Thursday, Jan 15.-Considerable retivity was manifested in stocks to-day, though but few sules were effected. Inquiry was made for several stocks which have been for some time entirtiy out of demand. There with no doubt be greater activity in stocks in fufure, than duriag the past Fall or Winter. The developments made during the last few weeks in the various claims of this aud Gold Bull districts seom to have given renowed confdence in the richness and permanency of the poines of Washou. The Norton Cumpany made a rich strike to-day, -the game which caused the sndden advanes of that stock in the Sun Francisco market a week siuce. The Orieutal, at Gold Hill, is aaid to have struck a ledge which has tho appearance of veing valuable. The ledge has been penctrated with a tunnel about 6 fect, but has not yet reached the opposite side. This Company was formed for the parpose of rumbing a tunnel of great and indeffinite length into the hill west of town. They claim several ledges on the line of the tunnel.
Sacramento is in demand nnd saleable at $\$ 35$ por foot. This Company has commenced operations on their lower tunapl, with good, results, which probably does mucle for the better pepate of their stack ${ }_{9}$, Some inquiry is made for La Crosse, for which $\$ 17$ is offered. The evident approach of a Jawsuit appears to have brought the atock of this Campany joto more favorable notice Inquiry is made for J . S. Tunuell stock. It can be sold at . low rates. Cedar Hill Tumel is without demand. Several importaut sales h ave talien place to-day.
Friday, January 16. There is some demand for clalma ant prominent in the market, but generally at lower ratea than bolders are williug to acin the market, but generally at lower ratea than bolders are williug to ac-
cept. Those ouly who are in pressing want of money will accede to the cept. Those ouly who are in pressing want of money will
terms of the buyers-consequently few transfers are noted.
Sacramen to is in demand at $\$ 40$, a material advance over last quotations; but little, however, appears in the market at any price. Ten feet sold today ut 40. Beach Paxtou bre taking out some fine looking rock. Their stock appeare to be ontiroly withdrawn from the market; $\$ 30$ is offered without finding sellers. Tho Flowery Hill Co., alluded to on Monday have struck ground in their tunnel which iadicates a near approach to their Jedge. The Yellow Jacket has enjoined the Union and Laboring Companies Jedge. Tbe Yellow Jacket has enjoined the Union and Laboring Companies
from further operations on their claims. The Birdsall Company Lave atfrom further operations on their claims. The Birdsall Company have at-
tained a depth of 150 feet from the bottom of their shaft and are about to strike their ledge at that depth, Nine feet of this stock sold at $\$ 20$ per foot. Some 300 of Yolo have changed hauds at rafes which are not made public. The stock is in great demand at low rates.
Saturḍay, Jan. IT-There was some enquiry, to-day, for Saeramento at \$40; Beach \& Paxton at 25 to 30 ; for La Crosse at 16 to 17, and for Birdsall at the same figures. Prices asme as lastquotationg. The business of the day has been light.

## HUNTROLDT STOCK.

A small asle of Humbotdt stock was eifected in Virginia City on the 10th Instant at low rates in several clains at an average of $\$ 3$ per font. Considerable stock atill remains in the market. Accounts from this district according to the Territorial Enterprise are somewhat less satisfactory than the predictions of six months since had warranted. One or two mills commenced operations there a few weeks since, and the returns from the ores of a number of the ledges was quite meagre. In one instance where the sassys had engendered large expectatione, nothing more precious than lead and antimony was obtained from a crushing of ten tons of rock, Before and antimony was obtained from apeus inrce mills will be in operation in the Humboldt reglon and the value of the mines there will be in a measure settled. Assays amount to value of the mines there will be in a measure settl
but little in arriving at the actual value of a mine.

## California Copper Mines-Practical Suggestions.

Editor of Mining and Screntific Press-Sir:-Having noticed some time past, through the medium of your journal, that while the capitalists of this State, especially those of San Francisco, are deeply engaged in the gold and silver mines of Washoe, and other places, and that they are also turning their attention to the development of the copper lodes, in various places and throughout this State, and having bad several years experience in the working of such, in the mines of Cornwall, Eng., I beg you will give insertion to the following remarks and suggestions which $I$ have thought proper to hand you for the perusal of your readers.

The mineral indications, from vhat I have seen and heard in a this country, far surpass in value and extent those of England; so much so, that where the latter have only a few colors and those at a considerable depth, you have paying rock from the word go, and in some instances, in very respec-
table quantities; consequently with proper and judicious management, the copper lodes of California must, ere long, figure most prominently, and will most undoubtedly prove to be highly remunerative to the speculators, whilst those of England to the first, second, and in some cases to the third parties, proved a failure, but little or no copper being
found till at the depth of two or three hundred feet, conse found till at the depth of two or three hundred feet, consequently many mines were abandoned, leaving immense riches still at a greater depth. With these facts in mind, the
speculator here maythink himself blessed; for in comparison with the "Old Country," he can not only see but feel his way. This the most skeptical mastadmit, for we have the ore, in many instances, sticking out at the surface, and with practical men as managers, such mines must prove to be of the first order, and unquestionably good.

As a Superintendent of Copper Mines, I have had several years practice in Cornwall, and would recommend to those engaged in such in this Country, strict adherence to the keeping of the Working Plan, it being, according to my ideas, a desideratum of the greatest importance to both Company and Agent, however competent the latter may be. For instance, a Working Plan shows him, at a glance, the exact position of the different points of operation, and whether the bearings of the levels above, and below correspond, and likewise the distance of underlie between the same In many instances where the Superintendent has not the assistance of this, the productive part of the Lode has been lost, caused by a "split off," the same being so minute at the separation, as not to be noticed; for where this occars, there is generally a change in its bearing, but, of so little a moment, as not to be perceived. When laid down on paper, however, it becomes apparent, and puts the agent on his guard. He examiaes the point referred to, and in many instances I have witnessed a branch, scarcely discernable, to have left the main vein, which, on opening, only few feat, has increased in size from three to six feet thick, and this the productive part of the Lode. In all cases where branches or spurs are intersecting the main part, they should be shown with the bearings, etc., on the Plan, so as to give the Agent, and also the buyer, and seller, an idea where to expect an improvement, or at least, the junction of the same on the levels above, or below; for in most cases it does benefit the concern.

There are many other desirable objects gained by due at. tention to said Working Plan, such as the extent and bearings of the different strata of ground in which the Lode is imbedded, whether highly metalliferous or otherwise. Also the junction of different strata, and whether lengthening in depth or not; for as a tree derives its fruitfulness from the soil on which it grows, so does a Lode, or Ledge, whith gold, silver, or copper, from the stratum of ground in which is is imbedded. Yours Truly,

Miner.

## SUGGESTIUNS ABOUT FOREIGN PATENTS.

American inventors should bear in mind that, as a general ule, any iovention which is valuable to the patentee in this country, is worth equally as much in England ad some other foreign countries. Four patents-A merican, English,French and Belgian-will secure an inventor exclusive monoply to his discovery among one handred millions of the most intelligeat people in the world.
The facilities of business and steam communication are such, that patents can be obtained abroad almost as easy as at home. The majority of all patents taken out by Ameri cans in foreigo countries are obtained through the Minine and Scientific Press Patent Agency. Having establish ed agencies at all the principal European seats of Govern
ment, we obtain patents in Great Britaid, France, Belgium, ment, we obtain patents in Great Britaid, France, Belgium,
Prussia, Austria, Spain, etc., with promptness and dispatch.
Models are not required in any Enropean country, but the utmost care and experience is necessary in the preparation of the specifications and drawingse
When parties intend to tak out foreign patents, engravings should not be published until the foreign applications bave been made.
Caution-It bas become a somewhat common practice for agents located in England to send out circalars soliciting the patronage of American inventors. We caution the latter against heeding such applications as they may otherwise fall
into the hands of irresponsible parties, and thus be defrauded into the hands of irresponsible parties, and thus be defrauded
of their rights. It is much better for inventors to entrast their cases to the care of a competent, reliable agent at home.
While it is true of Most European conntries that the system of examination is not so rigid as that practiced in this country, yet it is vastly important that inventors should have their papers prepared only by the most competent solicitors in order that they may stand the test of a searching legal ex. amination; as it is a common practice when a patentee finds a purchaser for his invention, for the latter to cause such examination to be made before he will except the title.

It is also very uosafe to intrust a valuable invention to any other than a solicitor of known integrity and ability. Inventors should beware of speculators, whether in the guise of patent agents or patent brokers, a
trusted with valuable inventions.

Our Mint, its Rules, Charges and Operations.
In the columes of a contemporary we observe some ex ceedngly interesting statistics of mint matters for many years past, from which we glean the facts that the legal limit of wastage was $\$ 207,76699$ for the three years ending
April, 1857, while the actual loss was $\$ 266,31286$, exceedApril, 1857, while the actual loss was $\$ 266,31286$, exceedyears of Mr. Hempstead's Superintendency, the legal limit was $\$ 235,38639$; while the actual lost was only $\$ 4,52035$ being some $\$ 230,000$ less than the limit, and, in fact, a little under two per cent. of the amount allowed by law to be
wasted. The wastage of the Philadelphia mint is twentywasted. The wastage of the Philadelphia mint is twentytwo per cent., against two per cent., wasted by our branch
mint. The total expenditures for three years under Messrs. Birdsall \& Lott, amounted to the large sum of $\$ 1.019,275$ 39. Under Mr. Hempstead, the total expnnditures for four years were but $\$ 1,150,64814$; while the difference between
the last year of Judge Lott and the last year of Mr. Hemthe last year of Judge Lott and the last year of Mr. Hem-
stead was upward of $\$ 100.000$ in favor of the latter. On retiring from the Superintendency, Mr. Hemstead left an noexpended balance of appropriation due the mint of up wards of $\$ 86,000$. This certainly is a capital showing for
our mint, and speaks well for Mr. Hemspstead's Superin our mint, and speaks well for Mr. Hemspstead's Superin
tendency. Under Mr. Stevens, the present Superintendent. we have no doubt everything wil work in an equally satis factory manner.

## CORNS AND BUNIONS REMOTED.

DR. BYRON O. KENNEDY, practical CHIRopodiss, late of Philadelphia, would most respectfully inform the citizens of San Francisco that he has opened his office at No. 12 Montgomery street, opposite the Lick House, where he is prepared to remove all excresences, such as Corns, Bunions, Inverted Nails, Enlarged Joints, Swelled Insteps, Frosted Feet, Chilblains, Callosities, and all diseases of the Feet without pain or incoavenience to the patient.
Dr. Kennedy also attends to Ganglion, or Scorbutic Ulcers, and all other diseases of the Skin. He may be consulted at his office, No. 12 Montgomery street, opposite the Lick House, from 9 to 12 A. M., and 2 to 6 P. M. Having devoted six years of study to this important, hat too much
neglected, branch of human knowledge, and having studied neglected, branch of human knowledge, and having studied
anatomy under the most skiful and scientific Prolessors of Philadelphia, and having made this branch of surgical science my speciality for mine years. enables me to operate skilfully and successfully. In England, France and Austria the highest prizes are often awarded to practitioners in this branch of surgical science, and it occupies with others an equally lotty position in the profession.
Voizin is an illustrous example, a shining light, among the philosophical stars of Europe, and Dr. Byron C. Kenne. dy has fully equaled him in this country, as a proof of which the Faculty of the University College of Philadelphia, $\mathbf{P a n j}_{\text {an }}$ Dr. Klimented him with testimonials.
Dr. Kennedy has bent his earnest attention to the cure of these diseases, in which he has become so great an expert that he is now regarded as the leader in this country, in this branch of the profession, throughout the United States.
The following letter, which emphatically speaks for itself was written by Dr. W. L. Stevens of the University College of Philadelphie: Dr. Branon C. Kenseny : Dear Sir-Learning that you are going to tine
your departure for California, and wishing to inform the citizens of Yhis-
delptis and also the people of the State of California the esteem in which we the oncouragement which youmg may recerve from the people of Phula-
than the
delphia, in the midst of owhich is the playground of your boyhood, and delphia, in the midst of owhich is the playground of your boybood, and
koowing that you have devoted yearo of sidut to this important but too
much neglected branch of human hoowledge; that you have altained to the hig
citit
com comment you with confideuce to the citizens of sai Frabcisco, as one of the
most skiful surgeons of the age, and we hope your success may be such on,
will real will renay you for your yenra of study, ayd that you may find a broad feld
or your exertio sin the pew and growing city of the Pacific.

THE EYES! THE EYES!! THE EYES/!! DR. E. H. PARDEE,
Oculist and Aurist to the San Francisco Deaf, Dumb and Blind Asylum.
After a protracted blindness of more than five years, Dr. PARDFE has made bimself thoroughly and scientifically acquainted with all diseases of the Eye, and is now practic-
ing with a success that cannot be surpassed in the United States ; and as proof of this he substantiates by many cases now in California that have been cured by hinn, after having. exhansted the skill of the eminent physicians and oculists on New York city, Boston and Philadelphia.

From an extensive practical knowledge of more than 14 years, Dr. Pardee asserts, and is prepared to prove, thati
there has been more blindness from bad and iroproper treat-1 ment than from disease itself-how can it be otherwise when we take into consideration the effects of the old hacknied course of local treatment that patients undergo-Caustio to-day and Bluestone to-morrow-more painful than death, and always more tedious than the disease. Patients are daily presenting themselves with chronic cases, and on in quiring what had been formerly done, the almost invariable reply is, "I had my eyes burned with canstic or bluestone;" week-had a blue pill prescribed for me at night, and salts in the morning-was ordered in a dark room-to keep my eyes tightly bandaged - to avoid the open air and exercise? with fifty other inconsistencies, the aggregate of which is sure blindness. Patients should be careful and not place their ejes at the mercies of a man who does nothing but bura them daily, not investigating the circumstances of each particular case, but ignorantly and blindly adopting and following theories the most erroneous, and destructive to the
eve. How much more rational and consistent to consult an eye. How much more rational and consisient to consult
experienced Oculist, who thoroughly understands every dis ease of this tender organ in all its aspects and varieties. $\mathrm{Dr}_{\text {r }}$ PARDEE has from sixty to one hundred patiects under his daily supervision, and, with but very few cases, they have all been treated by other physicians hefore applying to him-and
all to no benefit. Those who are doubtful are permitted to call at Dr. Pardee's office and confer with the many patients who convene there between the hours of 9 and 12 in the forenoon. The Dr. has a large and only assortment of Artit ficial Eyes on this coast, inserted, having all the movements of the real eye, and that they look so life-ike that no one can
tell them, when properly inserted, frcm the real eye. These eyes are sold reasonable.
All the operations performed, such as "Strabismus," or cross-eyes-" Cataracts"-or removal of the Lens by absorp-
tion or extraction:-" Plerygium," or fleshy membranes growing over the eyes. Artificial Pupils, \&c.

## Kegarding Patents.

We desire to call the attention of all those who intend pplying for Patents, to our superior facilitios for obtaining he sume. Our arrangements are such that we can have all
he papers prepared,transmitted and returned, with the Patent kight, io three monthe from the time the applicant places his matter into our hands; thus saving at least three nonths delay.
The expense to the applicant would be rather less, if the usiness be done by us, than if the papers were sent to iew York or Washington.
Thus by patronizing a home institntion, our inventive itizens can save both time and money.
We have prompt, intelligent and reliable agents in the ity of Waskington who attend punctually to all Patent usiness sent to them. We have agents, also, at London, 'apis, Brussels, Mamburg, St. Petersburg, Berlin, Vienna, nd other European capitals.

RECENT PATENTS-Granted to California Inven ors through the Pacific Pateut Agency.

Herman Camp,-Patent for Quartz Crusher and Amalga-
W. H. Ricrardson-Patent granted for Washing Ma E. E. Matteson, Nevada: Hydraulic Derriclc. This nvention has been illustrated in this journal, and has obained great celebrity hroughout the State.
Elander Heatra, San Francisco, Spiral Spice and Suge Mill. See "Mining and Scientific Press," June 9th, P62, Vol. V., No. XII!.
G. F. Deetken, formerly of Nevada: Apparatus for separating Gold from Pyrites. This is one of the most aseful inventions of the day. Mr. Deetken has successfully worked sulphurets for a number of years in Nevada county, professes to bave obtained greater results than others eugaed in the same occupation. Mr. D. has recently established himself in this County, on the San Bruno Road, near he Islais Cre ${ }^{\text {ek, where he has erected chemical and metal }-1 .}$ urgical works.

## THE FLOOD IN THE OPHIR

Thי "Incal" of the Territurial Enterprise, in the issue of Tanuary 21 st, \#rive a particular accuant of the recent intua of water inte the Ophrand Mexican Mines, in Virginin ('ity, from which we combense, as fullows:-
The watur was stuek in the OI hir abut noon on Sinmelay the 15 th inst. Some hamle were working in a western lrift, and upon strking their pick: hrongh the clay casing of a ledre, (the Viremina prubalily) a thit $y$-five or forty-inch stream of wa'er burst furth. It is said that the men linati to drop everything and run for their lives-it was no time to (ioul away brecious mumme in tryiner to lug their tools away with them. Althenghthe. Ophir and spanish join ench oth r, the men in the latter dib not know of the accident which hal befuflen their neinhlurs until some four hours after its occurvence. This breew the Epanish folks sumewhat be himbland in preparing :avainst the trouble so suon to come $\mathrm{c}_{\mathrm{i}}$ min them.
The stream, at the time of the visit, some 50 hours after he water had burst in, was still suthe 2.5 ro 30 inches. It had hen formed a kind of sub,terranean lake abour 21 feet deep if 30 in width and 100 in length, and was still rising, in ite of the utmost efforts of the pumps to kecp it down, of churse all mining op rations were at once suspended and force of aboat 8u men set to work putting in extra timberfar to secure the mine from caving when its sides above the hen water mark should bo submerged.-

Ore Tests.-Several inquiries have been made to us of he different chemical tests that will discover traces of sil er and copper in the rock. Il wur frients who ure conver ant with this matter will forward inlurmation respecting weh chemical tests to us, we will be hapny to give thern publicity. [Amedor Ledger:
Persons interested in the above wil find the desired in Wration, and much more in the same connection, all valu ble to copper and silver prospectors, in late nambers of this saper. A remittance of six months or a years subscription , the Mining and Simentific Press, will afford them all the aluable iufurmation oltainable from books in relation to brospecting for either silver or copper, and assaying and esting ores of the same. 'The dissemination of that clas If information is the speciality to which this paper is derofed, and no mineral prospector in the silver and copper re sions of California can invest $\$ 4$ to better adrantage than by seuding the same to this office and becoming a subscriber and reuder of the Press. We shall be extremely happy to receive the names of all who may favor us with cash patron age. We also pledge ourselves at the expiration of the gear to refuud to any party double the aurount of his subs. scription, who may honestly think he has not got the worth of his money in valuable information from our colums.

A Long and Expensive T'unnel.-According to the Butto Recorcl, the Eureka Tunnel Company having succeeded in runaing their tunnel throurg the rim rock, on Table Mountain, [near Orovillo] commenced washing on 5th January This tunnel, we believe, is about 2,000 feet long (throngh hard rock) and has taken neculy seven years to completo

The enal mining internst of Califurnia is bergiuning to assume an arpeet of no incursiderable importance. Although the coals hitherto produced are gencmully of an inferiou quality, the indications, in scveral localities, are su ha as fully wartat us in cxpreting great imporements in this particular as the excavations grow deeper. The Healsburg Coal Mining Company in Somona county, are so well satisfied that such a result may be expected, that they have decided to sink their main shaft, Thy 31,2 feet in size, (which is now down abont $6 \overline{5}$ feet) to a depth of two hundreel feet. The work in this mine is being pushed forword wi h energy The coal niw being tiken from this mine finds a ready market in this city, at $\$ 12$ per ton.
The Folsom Compaxy, whose mine is a recent discovery have gone down some 15 feet in the ledge, the coal improving in quality as they descesd. The mine is located on the American river, about six miles below Folsoun: According to the Telegraith, printed at Folsom, the owners are greatly elated with the discurery
Prosprcting for Coal in tufe Mountans. - A shaft is now being sunk for coal at a point about two miles west of the Half-way House, Carson road from Placerville. Large quantities of a substance resembling liguite, and suffeiently carbonaccuas to burn under the blow-pipe, have been found at that place. The parties engaged mostly reside in Car son.
Colin in Tulare County,-A seam of coal was recently discovered, in the vicinity of the Slate Range, Distriot, in the Southern part of the State. 'The scam, where it crops out, says the Visalia Deltr,, is four feet thick, and the coal, even, from the top, burns freely, giving out'a grent deal of heat. That paper thinks it is what is called "soft coal" in the Lasteru market:. 'I he location is some 18 miles from the Morrow lead, in a southwest direction, with a level country intervening. The effect of this discovery has been to advance the rrice of ev ry foot of ground in Slate Range 500 per cent. more than it was a week ago. The lncky dis coverer himself will und ubtedly realize a fertune.

Cnst.-England produces from her istand mines more coa than any other nation ; and yet the coal mines of the United States corer a greater aroa, in square miles, than the whole area of the British islamds.
The auriferous a d argentiferous lands of the United States, and those solely on the Pacific coast, are greater in extent than three such kingdums as Great Britain and Ire laud together
Stretching a Fuint.-Commissioner Boutwell, in addi tion to other taxes on publishers, has deciled that they must take out licenses as "dealers"-because they sell papers to newsboys. What next 1

A Ratlitay has been completed across the Prenees The rond has been constructed at a cost of about $\$ 12,000$, 000. It has been built, exchsively, with Spanish capital The masimum grade is 76 feet to the mile.

DISTROYING IRON-CLADS AND OTEIFIZ WAR VES-
Some two or three months since it was announced that Mr. Whittaker, an engineeer on board the U. S. Sloop of War, Kearsage, had devised a plan fur destroying iron clads and other ressels of war, which appeared so practicable and of such national importance, that the enginere was inmediately dispatched from his post to Washington, to commuuicate directly with the Federal anthurties in that city. It is now still more apparent that there is sumedhing in the alledged discovery ; at all events, the plan is to be tested as appears from the following:-
The iron-clad steamer Ozark. 2, now in conrse of construction at Mound City, eight nilus above Cairo, Ill., is about 110 feet in length, will hare four propellers, and a turret, twonty feet in diameter, for two largu fins., The boilers are in and the armor put on for about sixty fect on both sides. First Assistant Engineer James IV. Whittaker is examining the vessel, with a view to apply his new invention for the destruction of ion-clad hoats of all kinds, haring been ordered there by the Secretary of the Navy for that purpose. It would not be proper to explain what the nature of this invention is suffice it on say that Mr. Whittaker has letters frum chicf engineers in uar navy and other scientific men, including Caplain Lricsons princinal engincer, wherein they express their utmost confulnce in the plan, and recommend a trial speedily. Commmer Porter is said to be highly delighted with it, and gratified that he is to have the first opportunity of testiug it.

LAKE SUPERIOR COPPER PRODUCT.
The Iake Saperior Miner sums up the probable yield of the Lake Superior Copper District, for 1862 as follows :"As intimated last week, our miues did better the past season than any one supposed they wonld. The shipments of mineral are larget, an I the percentage will certainly compare favorably with any past year. Fstimating the mineral in round numbers at 2,500 ton $=$, and its percentage at 70 , and we shall realize 1,890 tous of ingots from the year's productions. This metal, at the last market quotations, was worth 33 cents per 1 ib . or $\$ 660$ per $t$ n, and allowing the $\$ 60$ to cover freight, insurace, and smelting clarges, and we have the present net va'ue of the year's production, 1,890 tons of metal, @l, $\$ 600$ per ton, $\$ 1,134,000$. This is of course many thousands of dollar's more than wi I be realized on sales, as much was disposed of at lower fignres. According to the best data we now have, the mineral shipped from the lake the past season, will not exceed 7,001 ) tous of ingot copper, the sales of which, past and, future, will doub les average higher than last year. The amount realized from the crop of 1861 , has, we believe, generally been estimated at $\$ 3.500$,000 , which is not too high for 1862 .

Sirver in Nova Scoma.- $\Lambda$ letter from Nova Scotia states that, in prospecting for gold in the northem and eastern portions of the province, the writer found silver, as well as gold, in great abundance; that in every panful of earth washed from the stream be found pure metal: and veins of spar containing native silver trarerse the mountains on each side of the river, and are exposed. at some points along the sea-shore.

NEW MINING AND COLONIZATION ENTERPRISE.
Some months since an association of gentlemen in this city, dispatched two Agents to Lower Calfornia, for the purpose of selecting some suitable locality in that country, for establishing an American Colony for Agriculture and Mining purposes. One of these gentlemen was intimately acquainted with the Spanish-Mexicau character and spoke the Spanish language. They started upon their mission, and spent several weeks in exploring that region under the escort of a Mexican Guide, and at last selected a location known as the Llanos de Musquital (plains of the Mosquite, a very valuable timber) and lying immediately between the mining district of San Antonio, Cachachili, Ranchita and Las Canoas and Vartana Bay, at which latter point a site has been selected. The steamer Oregon, Capt. Wakeman, passes near this point on her monthly trips from San Franciscu to Guymas and other Mexican ports, and will stop for passengers when requested to do so.

When the object of their mission was made known to the authorities and inhabitants, the plan met with their most hearty approval and encouragement, and a grant of 125,000 acres of rich agricultural land, embraciog a valuable silver mine, was readily obtained, one of the conditions of the grant being that the grantees should introduce a certain number of settlers thercupon within a certain tims. The agents having returned to this city, the Company has fully approved of their action and opened an office at North-west corner of Clay and Front streets, where full information of the plans and prospects of the association can be obtained by those who are already engaged in the enterprise, and where any others desirous of uniting with the same are requested to call. By the payment of $\$ 200$, any person who can bring to the Association satisfactory testimonials as to character, etc., can become a member thereof, and joint owner in the grant, mine, town-site, etc. The number of shares is limited to 200 . All who come after, must come simp'y as purchasers, having no interest in the grant.

We have seen a private letter from the U.S. Consul, at La Paz, which speaks in the most favorable terms of the Enterprise, as embracing a tract of land very fertile and susceptible of easy irrigation. It produces native cotton, which grows wild to great perfection, samples of which, on the stock and on the ball, may be seen at the Company's office; where are also exhibited specimens of the ores of gold, silver, copper, etc., which abound in all the mountainous region of that country. Sugar-cane, tobacco, Indian-corn, etc., are raised there to the greatest perfection. The letter to which we have already alluded, states that the project meets with the heartiest approval of the people of that region, and that the colonists will meet with a most cordial welcome on their arrival.

All these facts and many others of importance and interest may be ma refully learned by calling at the office of the Association. From the information before us we feel justified in expressing the opinion that this Enterprise is one of promise, and well wortlyy the attention of any one who may feel disposed to seek a change of climate and country, or who would wish to embark in any adventure which night present a fair prospect of securing an early competence from a small investment of money and lubor.

The Calaveras Chronicle urges the importance of having manufactories established in the mountain regions for the parpose of making wines. It aays:-

If a company were to put up a wine press and cellars in some central place in this county, it would not be many years before a sufficient quantity of grapes would be grown to afford us a constant supply. Not only our ranchmen, but the miners could each have their patch of vines, from one to five acres, and, in the aggregate, produce tons of luscious large grapes. If business mea would turn their attention to making wine instead of beer, soda water, \&c, we would soon have brands of California wine manufactured in the mountain towns which would vie with the most celebra'ed now known in the market.

Sinaloa Silver.-The Cosmopolitan, published at Mazatlan, speaks quite higlly of the silver mines in the State of Siualoa. Mr. Joseph Capprise, of this city, has recently purchased some minesin that country, which are said to be good. He brought a ton of specimens with him on the Oregon.

## IVALUE OF MACHINERY IN WAR.

As the battery of the iron clad steamer Montauk weighs thinty-five tons, it is interesting to know that her entire chew will be less than seventy men. An old frigate required a ship's company of three kundred sailors and landsmen, and a guard of marines. These would man four of the new fashioned ships, and while every 32 -pounder on the frigate required the labor of 12 mell, the 450 -pounder of the Montauk is easily moved by four. This fact affords another remarkable illustration of the adaptedness of Yankee ingenuity to any emergency which may be presented. Without the aid of the newly invented machinery for working ship's guns, it would be utterly impossible to place such huge monsters as 450 -pounders with the other necessary smaller armament, on the deck of any ordinary sized vessel, and with these the number of men and supplies which would be requisite to work guns even on the most improved principles heretofore in use.

Silfer Discorery in Pensilctania.-Quite an excitement has recently been created in Butler county, Penn., by the discovery of a silver lead on the farm of Z. Cooper, of Slippery Rock. In relation to this discovery the Pennsylvania Herald asserts that the exi-tence of silver in this locality was known by the French during their occupation of Fort Du Quesne-Pittsburg-anterior to the Revolutionary war. Crusibles and other apparatus have recently been found in the vicinity which aided the recent prospectors in their search, which has finally resulted in a re-discovery of the mine. Mining operations are to be immediately commenced and works erected for the reduction of the ores.
Disasters and Losses at Sea.-The number of marine disasters, which have occurred to shipping engaged in the California trade, during the year 1862, as given by the San Francisco "Mercantile Gazette and Prices Current," is 112 ; 41 of which have been total losses. The amount of property thus sacrificed foots up at $\$ 6,518,189$. The losses oi the previous year were $\$ 1,722,247$.

Business Lossess.-From the reports of the mercantile agencies it appears that there were fewer failures in business in the Northern States, during the year 1862, than in any other year since 1830. The following table tells its story :

Fa lures in 1861.
Failures in 1862.
Number. Liabilities. $\begin{array}{rr}.5,935 & \$ 178,532,170 \\ .1,659 & 23,649,300\end{array}$
This is a good exhibit. It is also worthy of notice that unembarrassed bu:iness firms, especially those in the cotton trade, never made money as during the past year.

Putty.-Notwithstanding the insignificance which usually attaches to this article of merchandise, it sometimes figures as an important item: For instance:--The Virginia City Union says the amount of putty used about the Gould \& Curry mill has been enormous-not less than two tons is said to have been used in patting in lights and filling crevices, preparatory to painting, in and about that huge estab lishment.

Liability of Car Drivers.-A case which may soon have importance in San Francisco, has recently been decided in New York, in which the Court held that children of tender years, who may be injured while upon city railroad tracks, cannot be deemed goilty of negligence. In case of injury, therefore, to such persons, the sole respoosibility rests upon the driver, who, having the ability to stop the moving car, does not do so.

A Printer in Lock.-John Heckendorni, a resident ot Tuolumne county, has recently discovered a quartz lead, which prospects $\$ 879$ to the ton, being rich in both gold and silver. What proportion of the lead prospects at the above rate, we are not told; but, from all accounts the vein appears to be rich, and affords a fact of rare occarrence-a printer in luck.
Braring--It is intimated in Washoe mining circles that the El Derado Company has been suljected to a most exten sive and determined system of "bearing" during the past two or three months, and that the advertisement of the loss of 500 feet of its stock, as advertised in the Sacramento Union is an essen:ial part of this operation.

Unsuita ble Reading for the Army.-The Chaplain of the 2nd Massachusetts Reginent, in giving some good advice in regard to donations to the soldiers, thus bumorously sketch es the kind of books and tracts that wortliy people send, in the igtorance of their zeal, to the camps and hospitals:-
Gifts-we come to that-are sometimes useless. I have before me a lot of tracts addressed to sellers of ardent spis its ; that business is not carried on by our men. I have had a) quantity addressed to distillers; but we have no distillersi And tracts to Sunday school childreh, on their behavior it Sunday school, which is of another meridian. And tracts to Sunday school teachers on the preparation of their lessons, or how to greet their classes, and on visiting their pupilswhich is a work adapted to places where there are chiddren. And tracts on dancing-a fault to which there is little lias bility-as I remember but one instance, and I was glad when that took place-on the ground, closing at tattoo. could multiply the list, but you have specimens. What do we want of the unsaleable lumber taken from cobwebbed shelres of some institutions glad to get rid of it-but reckoning it at the usual price in their demands for more contri butions? Or of buudles of worn out Suuday school books? Or of piles of volumes of some Christian truth adapted to certain states of mind, of which ten copies are enough for a year? Or of tracts attacking Catholicism, to distribute which, even by chance, would effectually destroy all influence with many uen, even if a chaplain was fool enough to suppose it his business to try to make Protestants-which tracta I have carefully put into the fire?

Again, many bundles of good readirg are mere heaps of duplicates of what has alro ady betn widely circulated. Societies cannot tell what has been distributed, and they glut the market with some particular work, or volumes come to be thrown away the frst march.
Or works which excite only ridicule. For instance herif is a little bouk entitled "Valuable Hints to Soldiers," is-ued in Cornilll. It tells what a soldier needs: A "Bible; le does n't ; he needs a T'estament. A "cheap portfolio of he disengages the tube to smoke through. "Three flannel undershirts, ditto drawers, four or five pairs of woolen: socks!" I wish the man who wrote this had to march tho 800 miles our men have, with such a load on his back. Then t tells us that the soldier "should never sleep at night in the flannel shirt, drawers or socks worn during the day. How, when off on picket duty one night in two or three? How, when, at the close of a march he is too tired to do arything? "No one should on any account be in wet clothing." Suppose he bivouacs in the rain, as we have over and over again? Suppose he changes, and gets out again, mmediately? "Blankets must be aired in the morning." Of course, when up by fore daylight to march on, with justtime enough to pack one's knapsacks. "Soup may be omitted one dinner, and beef at another." How many courses do soldiers have? They are glad enough to get one article, even if they get down to green corn, as we all did on thes Rappahannock. "Never be afraid of good beef." No, nox of turtle soup or blanc mavge. "An entire meal should never be made of beans." What will he eat then, when beans are the only dish? In certain cases "increasing" thei quantity "of vegetablee." He can't increase it, especially à two-thirds of the time in marching he does not have any, Soldiers laugh at such directions. It may be a very good book, but it does a't suit the lattitude of a regiment that has been out a year and a half.

A Company is being formed in this city to raise trout by artificial means. They propose to create a trout pond near the Chrystal Spring House, San Mateo county, and impor trout spawn from Lake Bigler.
Mining Accidents.-The mortality from accidents in cos aines may be taken as fullows: In Prussis, 1.89 per 1,001 persons per annum ; Belgium, 2.8 ; England, 4.5 ; Stafford shire, 7.3.

Intertor Treasure Morement.-According th the Price Curvent, the receipts of treasure in this city, from the ints rior during the ten days prior to Thursday last, wer about $\$ 920,000$ in uncoined treasure, and $\$ 230,000$ in coil About $\$ 121,000$ was received from the Gould \& Curr Mine.
A Big Dividend.-The diridend declared by the Goul \& Curry Mining Co., on the 26 th inst., is $\$ 100$ per foot, an the Stock is now held at $\$ 3.250$ per foot-an enormous a vance on rates sixty days since.

Mining Surt.-The Hale \& Norcross Company commen ed a suit in the District Court, Virginia City, on the 17th ul os. the North Potosi, for possession of certain minir ground. The former suit was to quiet title-the presel s for possession of a certain "drift," now held by the Nor Potosi Company.

till Jan. 15 th.

Mammoth Ledge Mining Co. give notice of an assessment levied and payable on or before Jan. 13th. Also that the first annual Meeting for the election of Trastees will be

Hale \& Norcross S. M. Co. have levied an assessment of $\$ 5$ per share payable on or before Jan. 26th.

Mareditu Guld \& Silubr Minisg Co.-An assessment of two and a half dollars per share (five dollars per fo $t$ ) was levied by this Company. Dec. 11th, payable imnediutely, at office, 712 Montgomery sit.
Bendow G. \&E. S. M. Co.-The Stockholders are notified that thes will hear something to their advantage by calling at the office of tho Company, cor. Piue aud Muntgomery Sts.
Emarrt G. \& S. M. Co.-An assessment of twenty-five cents per share was levied, Nov., 2lst at.d is now due, aud payable at office 326 Clay St.
Vibbard G. \& S. M. Co.-An assessment of 25 cents per share was levied, Nov. 21st, and is now due at office 326 Clayst.

Doyle G. of S. M. Co.-An as essment of 25 cents per sharo was levied, Nov. 21st, and is now due at office No. 326 Clay St.

Charles Ciny Mintang Co.-An assesment of $\$ 150$ per share was levied on the stock of this Company, Dec. 14th 1862, payable on or before January 14th, 1863, at office, 338 Montgomery St.
Live Oak Copper Mining Co.-Office, Montgomery Block - An assessment of thity cents per share wus levied, Dec. 1st, 1862, payable in thirty days.
Norti Potosi Silver Mining. Co.-An assessmeat of four dollars per share was levied on this Company, Dec. 11, 1862, parable on or before Jonuary 16th, 1863, at office, Cor. Buttery \& Washivgton Sts.
Iowa Mining Co.-An assessment of Four Dollars per share was levied, Dec. 4th, payable at office 522 Montgomery St. on, or before Jan. 3d, 1863.
Josernine Mining Co.-An assessment of iwo dollars per share was levied, Nor. 19th, and is now due and payable at office No. 21 Stephenson House.
Buraside S. M. Co.-An assessmer.t of one dollar per share was levied, Nov. 17 th, payable within 30 days, at office $\uparrow 12$ Montgomery St.
Hawley Mining Co.-An assessment of 50 cents per share was levied, Nov. 15th, payable at once, at office 204 Front St.
American Quicksilyer Mining Co.-An assessment of one dollar per share was levied, Dec. 16 th , payable at Company's Office, in Petaluma, within 30 days- $A$ t the expiration of which time delinquent Stock will be sold.
Burning Moscow S. M. Co.-An assessment of Two Dollars ree share was levied, Nov. 25 , for the purpose of de traying expenses of steam pump and machinery now being erected to drain the mine. Prompt payment is requested at the Company's office, corner of Mon'gomery and Jackson Sts., to Jos. P. Nourse, Sec.

## WASHOE MINING NOTICES.

Martin White.-An assessment of 20 cts. a share was evied, Jan. 2.
Oriental G. \& S. M. Co.-An assessment of 50 cts. per share was levied. Jan. 14. pryable at Office, cor. Sutton Avenue aud O St., Virginia City.
Normon S. M. Co.-Middleton \& Sons, No. 40, Mont romery Block, will sell delinquent stock of this Company February 16 th.
Baltic Miving Co.-Notice is given of an adjourned sale of shares in this Company, to take place on the ground, Jau. 31st.

Progress G. \& S. M. Co.-An assessment of 20 cents per foot was levied, Dec. 27, 1862, payable forthwith.
Sweesy Co.-Washington Ledge--An assessment of $\$ 10,000$. being $\$ 51 / 2$ per foot-was levied on the stock of this Comyany, Dec. 28, payable at the Secretary's Office. Medan Building.

Miners' Merting.-At a meeting of the shareholders of the Siegel Mining Company, it was resolved that a meeting be called of all the miners of the Siegel Mining District, for the purpose of making laws by which said District may be governed, and that said meeting shall take place on the 15 th day of January, 1862, in said Siegel District, in or near a certain place better designated as the Siegel Min ing Company's Cabin.
Caution-D. M. Tyrell warns persons against purchasing certain 10 feet of ground in the Wellington Co., standing in the name of J. B. Magee-also 20 feet, standing in name of W. Williams. (See Territorial Enterprise.)

Ashland Co.-L. A. Gould, in the name of the Moss Ca notifies the Ashland Co. that their westerly drift has cut the Lamb ledge, in the Moss Co.'s ground, from which the Askland Co. is forbidden to extract any valuable metals.
Eldorado G. \& S. M. Co.-An assessment of one dollar
per share was levied, Ded. 31, 1862, payable, Jan. 22, 1863, to the Secretary, at corner of Montgomery and California streets, or to the Superintendent at Virginia City.
La-Plata Oro Co.-Gold Hill District.--An assessment of wo dullars per share was levied, Dec. 26, payable at once,
at Office of the Secretary, Court-house Building, Virginia City.

The Regular meeeting of the Company for election of officers, will be held at the Comet Saloon, Firginia City, on Saturday, Jan. 21.

The North American Co., Gold Hill, will sell at auction Jan. 31, stock of shareholders deling aeut in puyment of sesaments.

Martin White Mining Company.-An assessment of ten oents per foot has been levied, payable to the Secretary, at cffice on O Street, Virgivia City,

Tue Sweeney Co., Guld Illl, give notice that Baltic Company have wrongfuly claimed and worked their ground since July, 1860.
Pogrmax G. \& S. M. Co.-An assesement of Five Dollars per share was levicu, Nov. 9th, and another of Ten Dollars per share, Nov. 21, payable at once to the Eecretary, R. J. Mi.chel.
Coledonia Tunner and Minina Co.-An assessment of Thirty-two Dollars per share was levied, Dec. 8th, payable immediately to the Secretary, Martin White.
The Chaney Rock Co., lying next west of the Tirginia Co. claims hare notified the Hazel Green, Tingley and Biach \& Paxton Companys that they are tresspassing upon the Chimuey Rock Co's ground.
La Crosse Mining Co.-An acsessment of $\$ 125$ per share was levied, Dec. 8th. payable at office 73 C Stieet, Virginia City.
Hawi Eye Silter Mining Co-An assesment of 25 cents per foot was levied, Dec. 6th, payable immediately to S. A. Kellogg, Sec. Gold Hill.

Monegan Co, Cedar Hill--An assessment of fifty cents per foot was levied. Dec. 5th, payable forthwith, to the Secretary at Virginia City.
Oriental G. \& S. M. Co- -7 he 3 d assessment of 15 cents per foot, was levied, Dec. 8th, and is payable at office, No. 31, C Street, Virginia City.

## ESMERALDA MINING NOTTCES.

The Zanobia Lade Company, give notice that they claim Euperior title to the Johnson Co., claiming the same ground, so far as said localities conflict. This ground is a portion of that now held by the Company known as the Wide West Company. The notice is signed by A. Waddell, J. C. Dorsey, S. P. Dorsey and James Elder,

## MINING AND SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICL AND SCIENTIFIC Paper on this continent.

## THIRD TEAR: VOLUME TI-NLN SERIES!

A uew volume of this extensively circulated paper commenced Sept. 11,
1862. It is intended that evory number shall be replete with inform 1802. It is intended that evory number shall be replete with information with for its columns.
This its columns.
of science, artepoted to the above purposes, together with the interests that may bo of interact to the and Commerce, and any general information or to spare no paius or expense in making it is that in interest and valuable oformatiou to any paper yet published.

## The Mining Interest!

Will find it of grat ralue, as it will contain all the news appertaining to Mining, the prices and sales of sfinmg Stocks, now inventions of Machinery adhited to that purpose, and of everythusg gencrally that may be of servic to the 3liner.

## The Inventor !

Will find it an excellent melium for the purpose of bringing his in rention into nntice, of ascertaining the progress of invention in this and other countries, and also of receiving myy information that may be necessury in obtaining his patent, the proprjetor having had great experienco as a
Patent Agent, together with facilities at Washington that cnable him to ol ain Patents with dispatch.

The Mechanic and Manufacturer !
Will bo greatly benefitted by its perual, as each number will contan ser eral original engravings of new machines aud inventions, tagether with recojving the best scientific journala from all guarters, from which we slall cou
readers.

To Chemists, Archilects, Milhwrig7ts and Farmers! This journal will be invaluable. All new discoveries in Chemistry will be given, and $a$ large amount of information of great service to Architects ands
Millwrights will be found in our columns. The Farmers and Planters will not be neglected, erigravings will be given of agricultural implements, and the farming interest generally will be amply discussed.

LOOKING ATTER THE MINING INTEREST.
The Pacific Railroad Act grants to the Compauy constructing the roat, all the timber upon certain lands lying rontiguous to the rante «hich may be selected, and which grant is so worded. that it may be construed so as to effectnally prevent miniug upon said lands, by proh bitivg the cutting of timber, \&ce. In consequence of this provision in the Railroad Bill, Mr. Atkinson of Yuba, a few days since introdnced the folloring Resulution into the Lower House of the Legislature:-

Rcsolved. By the Assembly, the Senate concurring, that our Senators in congress be instructed and our Representatives requested to urge upon Congress the enactment of such an supplemental lam as will guard the mining interests of this State against any such injurious construction of said grant
The Resolution was reterred to the Cummittee on Fedcral Relations, which has reported it lack with a farorable recommendation for ita passage. The Resolution came up for discussiun on Tuesday. The mining delegations rere generally farorable to its passage. The tenor of their argunent was, that while nothing should le done by this State to discourage or delas the cunstruction of the road, the utmost care sliould at the same time he taken to protect the mining interest, from whose decay the state and railroal would both suffer. If Congress did not meau, in grantiug to the Central Pacific Company the timber for every ten miles onalternate sections of land along the road, that it should be enjored to the exclusion of miners, would it not be well to say so in a Supplemental Act?

It is evideut from the wording of the Bill that unless the miners are explicitls secured in the righit to use what timber they may need, loy such a supplementary Act, the time maty come, when they would be enjuised, and the mines which may be found within the territory falling to the Railroad C'ompany be effectually placed mithin their absolute control. It is not suficicut that the Company should come furward at this time and explicity withdraw all intention to interfere with the rights of the miners. If the Compans is sincere in such denial, it can hare no oljections to having the matter clearly defised hy Legislative enactment.
P. S. Since the above was in type the Resolution has come up in its turn, as the Special Older for the day and been lost by a rote of 32 to $3 \pm$.

The Ocean Steamers.-M. O. Roberts adrertises the following vessels as belonging to his opposition line of steamers from New Fork to San Francizco: Tllin:ois, 3,000 tons; Empire City, 2,000 tous; Moses Taylor, 1,500 tons: Ameriea, 2,000 tons ; and the nows stenmship Bonaparte, 3,000 tons. The Moses Taylor sails on the 11th instant.
The P. M. S. Lane.-The Pacific Mail Steamship Company advertise the Constitution to sail on the 11 th instant, and the St. Lonis on the 21st. 'The Sonora sailed on Saturday. All the above, on both lines, are well built and sub.stanqial sea going steamers.

## HUMEBLDT NOTT A FAILURE.

An unfavorable impression with regard to the value of the Ifumboldt Mines bas been created in this city, within a few days past, $1, y$ an unconsidered item which appeared in a late number of the Territorial Einlerprise. The item in question was to the effect that two mills had recently been started in that district-had crushed rock from several of the principal ledges, with results of the most meagre description. It was stated that ten tons of ore from one of these ledges, supposed to be the richest in the district, yielded nothing more precious than lead or autimony. The substance of the item under its proper credit, uras trausferred to the columos of our last issue. Since that time we have conversud with parties from Humboldt, from whom we learn that the item in question, was entirely without foundation. The Enterprive has also exhonomated itself io the premises ly maning its athurity.

No such amount of rock, as that named has been crushed from any one lead in Humblalt, up to latest ahrices. excent from the "National," which is a gold lead and contains no appreciable quantity of cither antimony or lead, or, we beliere of silser-gold being its only return:
If the Ifumboldt Mines are to result in a failure or even anything approaching to a scrious disappointmeat, the fact has yet to be proved. It is still confumbly helieved by those lest informed, that this districe, when it com ss to be fairly developed, will prove to be quite as rich as Virgiaia City: or any other place.

Since the abore was put in type we have received the Enterprise of Jan. 27th, in which the "local" of that paper re-iterates his previous aseertion with regard to the crushing with poor results, of a quantity of ore at one of the Humbohlt mills, and s.ys
mits the crushing, but accounts the Sacramento Chion ad mits the crushing, but accounts for the measer return on the supposition that the reck must have beco of a quality infe-
rior to the meneral averare. rior to the general average.

A currephodent of the
shing, amd explains the Bucletin also acknowledges the crushing, ambexplains the ansatisfactury result ly saying: "Dudge of cu., of the
Sheba Nill, hare hicen expemimenting urou the best mamer of saving the metal. and it will be clionn early in the spring that the mines of the Inmbolut and Iieese Rivens are as rich as any get discover d." Another correspondent of the same paper, of the same date, likewise admits the working
of the ruck. His explanation of the canses of the faiture of the ruck. His exphanation of the camses of the fature
howerer-for a failure is not deuied-differs somewhat from the avowals of others. He sajs

"Wre leare thereader to reconcile these conflicting authori ties, and weigh the result against our simple statem nt."
Being satisfied in our own mind that "somebody had blunlered," we called upou Mr. Dodge, of the firm of "Dodge \& Co.", proprietors of the Sheba Mill, whe is now in this city, but who was in Humboldt at the time the mill was sta ted. He confirms what we have learned from various other sources, that only the small quautsty of rock. already alluded to, has yet been crushed from the Sheba rein.
In relation to the extract above quated from the Bulle in, where the information purports to bave been derived from Mr. Dodge, that gentleman explains as fullows: The information was given to the Bulletin conespondent in a private conversation, and the "process's" alluded to were simply land proc sses, conducted in this cily, and to the exteut of only three pounds of ore at a trial. The oljject of these experiments was simply to arrive at some correct and reliable method of treatiog the ore on a working scale at the mill. These results hare, thus far, resulted in fully sustaining the preconceired ideas with regard to the ralue of the mine. If the "local" of the Enterprise will read the above extracts from the Bul'etin attentively, he will, see that he was not justified in inferring that those "processes" were tried at the mill. The witers, evidently did not intend to convey any such idea. The last paragroph of the latter quotation would soen to settle that matter for one of them at least.
With regard to the correspondents of the Ution, we
would simply say that the proprietors of the milh and of the lead, and their workmen all unite in the assertion that not a full ton of rock has yet been crnshed at the mill, and not a pound of what has been crusked, has been antalgamated by any other than a haud process.

## Mining Operations about Virginia City.

Mining operations in and about Virginia City never presented a more farorable aspect than at the present time. In the entire range of nearly three miles from Cedar IIill to Gold Hill, along the line of the Comstock Lead, nearly all the compames have reacheel their leads, and in a short tine many companies about which lit le is now heard, will be talking out rich rock. At Gold Hill, the damages of the lato slide have been fully repaired and the claims put in good order for working. The Mexican Mine is said to lave struck ore in their deepest shaft which, when assorted, is worth from $\$ 7,000$ to $\$ 8,000$ per ton. It is being prepared for shipment to lingland. 'The Ophir, which has recently been inundated with water, is recovering from its bath, none the worse for the drenching. It is more than probalile that the reservoir from whech this water has been drawn will prove to be a rich vein of ore The Gould \& Curry is now fairly in successful operation, though nut yet to its fullest extent. The dividend declared on the 26th ult. - $\$ 100$ to the foot-is snfficjent evidence of its richuess. When the great tumsel which this company is driving up to strike the land at a depth of 700 feet shall meet the vein, great developments may bo expected. The Caledonia tumel, three fourths of a mile below Gold Hill, is being pushed forward with the utmost vigor. This tumel it is expected will intersect ten distinct leads. It is now in nearly 2000 feet, and has passed through one leat, from which a stream of some 60 or 75 inches of water fras fluwing at last accounts.
The Ophir Company, according to the Tervitorial Eutermrise, comnenced gaining on the water in their mine on the 2?nd inst.-not a moment too soon. The lighest rise of the water was 80 feet, and reached within five feet of the the ga lery. Had it entered that gallery, much damage would have buen done. As it was, the work in the mine was nut seriously interfered with as it was mostly done in and above the 5 th gallery. The Mexican Company did not -uffer to any great extent. The Central and Califurnia were a little troubled by the seepage. The mines ahove the Ophir of course are greatly benefited by the disaster-1he Li Crosse and Burning Moscow were particnlarly bencfited. It will p:obably be some days yet beture the water in the lower portion of the Ophir mine will be entirely drawn off. In the mean time opperations in the wine will not bo seriously interfered with.
In the Sullisan district several good leads hare been de-- eloped. In the I'ámyra District good prospects are reported. In the Spring Valley District, the mills are getting out $\$ 20$ and $\$ 30$ per ton, which though not large is nevertheloss sufficient to encourage further operations. The Rock Point Nill has recently started with 40 large stamps, and wo large breaki gla teries, crushing 60 tons per day.
The Territorial Enterprise says says that a large number of mining companies are about to incorporate under the Torritorial laws-among them, the Beach \& Paxton, the Birdsall, the Oriental, the Pride of Wrachoe, the Zouave, and the York. That paper thiuks that within six months a a majority of all the companies of positive value, will incorporate there. It further states that an attempt will be made by a number of leading companies to have that portion of the Tervitorial Incorpation Act declared unconstitutional which requires the removal of the offices of California incorporatioss to that T'erritory.
The Copper Shipments. - Mr. Shields lias shipped 54 tons of o:e by the ship Perurian, for the Swansea market. This ure is from the mine of the Newton Company, Amador County, and is of an excellent quality. It is expected, that when the roads open in the Spring, large shipments will be made from that District.

Tre order of Court for a survey of the El Dorado works granted to the Gould \& Curry, embraces also a survey of the Rogers and Vanderbilt claims. These survejs, the Enlerprise thinks, point to a general settlement of boundaries

 feet Orieutal at $\$ 350 ; 15$ feel Hacol Green at $\$ 450$. Othor lorures rem:in, whthout anexception, at the quotations of yesterday.

Wudneslay, January 21st.
Very litile doue in Stocks In-day-people genorally ton mueh ousrowned in sletghng. A sute of 10 feet of In Crosse reported at Getres which the "Enterpise" esterms doubtrul, but quotes at $\$ 17$ to 20. Tent teet of Sacramutn iE quated at 47, an! 15 fret of Gollor at $5 \% / 2$. Theso trausiers embrace the entire snles of the day.

Thursday Eventig, Jia. 22nd.
Reports from San Franesco aro inspifing. Tho publlihed records of traasactions below do nut ruflect the inteusity of the general disforition to wvest in the mining stocks of Novad:. Everything aughrs favoratiy for the coming Stpring. Inquiry for Norton, Rogers, Allen, North Potosi, Sacrameutn, and Earage, at sua Francisco quotations reaches us from the Bay, but stocks seem to be holl somewhat more armly than in Catiforma. Few sales are reported to-day. El Doratlo is offered at siv0@ $\$ 50$; Birdsal at 820 ; Prile of Washneat $\$ 15$; Governor Nye at $\$ 5$; Wellington at \$70 @ 812 ; Oriental at $\$ 350$ : Hazel Green at $\$ 0$; Dunn at $\$ 4$ e 85 ; Sinalon at if $^{2} 50$ (il) $\$ 8$; Fairvicw at $\$ 20$; Cedill Kill Tunnol at $\$ 4$; U. S. Mikiag Compuny at $\$ 600$ per quarter interest; Zounve, $\$ 6$. These are the lowish rates at which most of the stocks meatioued can be obtained, aud amouts to market are limited.

Friday, January 231.
There has been some activity in the stock Market to day. Inquiry was made fir sicramento at $\$ 45$ to 50 -for Beach \& Paxton at 30 -for Birdaill at 17 to 19-North Potusi at 10 to 1\% and for Savage, Rogers and I'olosi at san Frouciso quotations. Hhters, hoswever, are tis-inctind to part with much atteution: hd a uumber of cluims which have slumbered for two years are wow coming iato fayor.

## Snturday, Japuary 2eth.

The week cluses with much firmness in all second rate Stocks. The fransactuns of the weck, however, do sot foot up largely, although the rates obtuned are generally satislictory to buyers.
Siemamenta shares cannot be bouglit at this time in Virginia City for less thau $\$ 75$ per fout. Sim Eraucisco quotations to the contrary, notwithstaudIng.
The Argentine District which has beea pretty much abandoned for the past 18 months is aguin fuding lavorable mention. A new claim called the Vulcan, the croppiags of which assay well, seems to be the fiverite. Sume considerable prospecting is being done and valuable ore my be foumb A few it the ctaims in langera aro held at large aguros. The summil still matinnes to attract sume altention. The Orizaba bas been eold lately for $\$ 150$ ter lout Sales to-day Lutre been light.

Monday Evening, Juhuary $=0$.
Wild reports from Reese liver have been in circulation towlay. Ore trom that region, asstying $\$ 20,000$ to the ton is exhibited, and maty tho preparing for an carly visit to the new mines. We trust the country may prove as rich in gold and silfer as the wildest dream of the prospecting enthiusiatl. but wo have little fuith j 1 thesc repoted assays. A watd to the wise jo sufficient.
The sales th-day have beenlimited. Transters of Zounvo were made at §0, of Traterlouse at \$3 20 , of Lirdsall al $\$ 1850$, of Alleu ut $\$ 45$, of Sacrimento ( 5 fuel) at $\$ 60$.
We quote U. S. Mming Co, at $\$ 2400$ per interest; Greanila Tunnel Co.
 Utah, 810 845 ; Sacrauthtn 860 e 865 ; Oriental, 3360 : Prinie of Wash 0e, $\$ 15$ ce $\$ 20$; Sauta Rita, E35 ; Cedar Gill Tunnel, $\$ 50$; Dumn, $\$ 4$; Sinaai, s7a $\$ 8$; Uuma, Gold Hill, $\$ 8$ © $\$ 12$.

## MEXICAN MINES

Iutelligence from the Mexicau Minos in Souora is highly favorable.
The Buna Plieta is fust moviug its machinery (which is of a very superior class) to the mine. It will probably be in operation inside of three moutbs. This in pronnunced one of the best mines in Mexico.
The Musidiora, upou tho same vein, has its tonnel in 80 feot, with about 50 feet more to run before reaching the rein. They expect to stike the roin is a little ovor two months.
The Brouces Mine is receiving ndational machinery, which they expect to bave ruuning in about fuar mouths.
The machinery for the Dios Padre, it Alamos, is most probably now upon the ground.
Additional machinery has also gone to the Guasapuxe Mine on the edge of Chihuahua. Capt. Fredorick Grifliu of this city bas recenily tiken a largo iuterest in this Mine, it now being eutirely owned by Americans-Griflu Hurd \& $C 0$.

## SUGGESTIUNS ABOUT FOREIGN PATENTS.

American inventors should bear in mind that, as a general rule, any invention which is valuable to the patentee in this country, is worth equally as much in Eugland add some other foreiga countries. Four patents-American, English, French and Belgian-will secure an inventor exclusive monoply to his discovery among one handred millions of the most intelligeat people in the world.
The facilities of business and steam communication are such, that patents can be obtained abroad almost as easy as at bome. The majority of all patents taken out by Americans in foreigo conntries are obtained through the Mining and Scientific Press Patent Agency. Having established agencies at all the principal European seats of Govern ment, we obtain patents in Great Britain, France, Belgiam. Prussia, Austria, Spain, etu., with promptuess and dispatch.

Models are not required in any Earopean country, but the ntmost care and experience is necessary in the prepuration of the specifications and drawiogse
When parties intend to tak out foreign patents, engrapings should not be published until the foreign applications hare been made.

Cadtion.- It has become a somewhat common practice for agents located in England to send out circalars soliciting the patronage of American inventors. We cantion the latter against heeding such applications as they may otherwise fall into the hands of irresponsible parties, and thas be defranded of their rights. It is much better for inventors to entrust their cases to the care of a competent, reliable agent at

While
While it is triue of Most European countries that the system of examination is notso rigid as that practiced in this country, yet it is vastly important that inventors should have their papers prepared only by the most competent solicitors in order that they may stand the test of a searching legal ex. amination; as it is a common practice when a patentee finds a purchaser for his invention, for the latter to cause such examination to be made before he will except the title.
It is also very unsafe to intrust a valuable invention to any other than a solicitor of known integrity and ability. Inventors should beware of speculators, whetber in the guise of patent agents or patent brokers, as they cannot ordinarily be trusted with valuable inventions.

## Our Mint, its Rules, Charges and Operations.

In the columns of a contemporary we observe some ex ceedngly interesting statistics of mint matters for many years past, from which we glean the facts that the legal limit of wastage was $\$ 207,76699$ for the three years ending April, 185\%, while the actual loss was $\$ 266,31286$, exceeding the limit some sisty thousand dollars. During the four years of Mr. Hempstead's Superintendency, the legal limit was $\$ 235,38639$; while the actual lost was only $\$ 4,52035$ being some $\$ 230,000$ less than the limit, and, in fact, a little under two per cent. of the amount allowed by law to be wasted. The wastage of the Philadelphia mint is twentytryo per cent., against two per cent., wasted by our branch mint. The total expenditures for three years under Messrs, Birdsall \& Lott, amounted to the large sum of \$1.019,275 39. Under Mr. Hempstead, the total expenditares for four jears were but $\$ 1,150,64814$; while the difference between the last year of Judge Lott and the last year of Mr. Hemstead was upward of $\$ 100,000$ in favor of the latter. On retiring from the Superintendency, Mr. Hemstead left an nuexpended balance of appropriation due the mint of up
wards of $\$ 86,000$. This certainly is a capital showing for wards of $\$ 86,000$. This certainly is a capital showing for our mint, and speaks well for Mr. Hemspstead's Superin
tendency. Under Mr. Stevens, the present Superintendent we have no doubt everything wil work in an equally satis We hare no doub.
factory manner.

CORNS AND BUNIONS REMOVED.
DR. BYRON C. KENNEDY, practical CHIROPODIST, late of Philadelphia, would most respectfully inform the citizens of San Francisco that he has opened his office at No. 12 Montgomery street, opposite the Lick House, where he is prepared to remove all excresences, such as Corns, Bunions Inverted Nails, Enlarged Joints, Swelled Insteps, Frosted Feet, Chilblains, Callosities, and all diseases of the Feet, without pain or inconvenience to the patient.
Dr. Kennedy also attends to Ganglion, or Scorbutic U1 cers, and all other diseases of the Skin. He may be consulted at his office, No. 12 Montgomery street, opposite the Lick House, from 9 to 12 A. M., and 2 to 6 P. M. Having devoted six years of study to this important, hat too nuch neglected, branch of human knowledge, and having studied anatomy under the most skiiful and scientific Professors cof Philadelphia, and having made this branch of surgical science my specia'ity for nine years, enables me to operate skil
fully and successfully. In England, France and Austria the highest prizes are often awarded to practitioners in this branch of surgical science, and it occupies with others an equally lotty position in the profession.

Voizin is an illustrious example, a shining light, among the philosophical stars of Europe, and Dr. Byron C. Kenne dy has fully equaled him in this country, as a proof of which the Faculty of the University College of Philadelphia, Pa., complimented him with testimonials.
Dr. Kennedy has bent his earnest attention to the cure of these diseases, in which he has become so great an expert that he is now regarded as the leader in this country, in this branch of the profession, throughout the United States.
The following letter, which emphatically speaks for itself, was written by Dr. W. L. Stevens of the University College of Philadelphia

THE EYES! THE EYES!! THE EYES!!!
DR. E. H. PARDEE,
Oculist and Aurist to the San Francisco Deaf, Dumb and Blind Asylum.
After a protracted blindness of more than five years, Dr. PARDFE has made bimself thoroughly and scientifically acquainted with all diseases of the Eye, aud is now practicStates; and as proof of this he substantiates by many cases now in California that have been cured by hint, after having exhausted the skill of the eminent physicians and oculists of ew York city, Boston and Philadelphia.
From an extensive practical knowledge of more than 14 years, Dr. Pardee asserts, and is prepared to prove, that there bas been more blindness from bad and improper treatment than from disease itself - how can it be otherwise when We take into consideration the effects of the old hacknied course of local treatment that patients undergo-Caustic to-day and Bluestone to-morrow-more painful than death, and always more tedious than the disease. Patients are daily presenting themselves with chronic cases, and on in-
quiring what had been formerly done, the almost invariable reply is, "I had my eyes burned with canstic or bluestone;" ' I was bled and blistered, then cupped two or three times a, week-had a blue pill prescribed for me at night, and salts in the morning-was ordered in a dark room-to keep my eyes tightly bandaged-to avoid the open air and exercise," with fifty other inconsistencies, the aggregate of which is sure blindness. Patients should be careful and not place their eyes at the mercies of a man who does nothing bat
bura them daily, not investigating the circumstances of each bura them daily, not investicating the circumstances of each lowing theories the most erroneons, and destructive to the eje. How much more rational and consistent to consalt an experienced Oculist, who thoroughly understands every disPARDEE has from sixty to ove hundred patiects under his daily supervision, and, with bat very few cases, they have all all to no benefit. Those who are donbtiul are permitted to call at Dr. Pardee's office and confer with the many patients Who convene there between the hours of 9 and 12 in the forenoon. The Dr. has a large and only assortment of Arti-
ficial Eyes on this coast, inserted, having all the movements of the real eye, and that they look so life-like that no one can tell them, when properly inserted, from the real eye. These
All the operations performed, such as "Strabismus," or cross-eyes-" Cataracts"-or removal of the Lens by absorp-
tion or extraction;-"Plerygium," or fleshy membranes growing over the eyes. Artificial Pupils, \&e.

Opposito Battery, San Frakeisco.
The question of taxing mining claims by the General Government, after a long slumber, ser ms to be again revived. The agitation of this suhject I cannot but regard as extremely impolitic. In a vast majority of claims it is impossible to estimate their value above what they may afford to the laborer from day to day, and with most of the balance th re can be no accertained permanency or reliableness of value upon which an assessment could be made with confidence or with satisfaction. A tax upon these claims can never be laid that would be ju.t in its burdens or equitable in its results. When the sagacity and toil, the anxiety and patience, of the miner are rewarded with success, the results of that success, become the subject 0 taxation and the source of revenue.

## ESMERALDA CORRFSPONDENCE.

$$
\text { Acrora, Jan. 30te, } 1863 .
$$

Mr. Fiditor :-Quite a large number of your citizens are taking advantage of the present spell of unusually fine weatirer, to pay us a flying visit, to examine our mines aud see for themselves. The hills are daily thronged with new prospectors, looking for "indications," and every thing in the shape of a quartz bolder, will soon be located and recorded and then, after the process of incorporation is gone through with, the stuck will be pushed into the market or pressed apon particular friends, as "wonderfully rich," or as a "good thing." A similar operation was enacted here last fall, by some parties from your city, but upon a somewhat smaller scale. I then cautioned the citizens of San Francisco not to purchase without first becoming posted in regard to the merits of this kind of mining stock.

## WRONO IMPRESSIONS CORRECTED.

I find by conversing with several new-comers that they have been misinformed, or rather, that they bave an iucor rect impression as to the name and location of these mines Many have the name of the county, the district, and the lown in their minds, as different mining districts. For the benefit of the mining public, I will correct this error ; Mono, Esmeralda and Aurora are all one and the same place; the only difference being this: Mono is the name of the county which embraces all, or nearly all, of the territory of he State on the east side of the Nevada, commencing at the intersecting point of the fouth line of El Dorado Counby with the State line, and thence south east, some two hunPred miles; Esmeralda is the name of the Mining District in the county of Mono ;"Aurora is the courty seat or chief Lown in the county of Mono, and is situated on a small flat at the base of Silver, Middle and Last Chance hills, the flat being formed by the conjunction of the gulches, making lown from these hills.

## silver hill mining district.

This District is sitnated about seventy-five miles northFest trom Aurora, and near Carson Cañon. I would have pour readers understand that "Silver Hill,". when spoken ol n connection with this place is not the name of a Mining District, but only a hill in Esmeralda District.
extent of esmeralda mining district.
The territorial exteut of this District is from East to West, from two and a-half to three miles; from North to South about three miles, and embraces the following named bills: Silver, Middle, Last Chance, Monterey, Humboldt, Aurora and 'St. Mary. The town of Aurora is nearly enclosed by these hills, upon which is located from twenty-five 0 as high as one hundred and fifty well defined gold and silfer bearing quartz lodes, and many of them exceedingly ich.

## THE MINES RICTI.

I have operated in quartz for the last twelve years, in Cilifornia and Washoe, but this District exceeds any thing else that I ever saw in the number of its well defined and
bajing quartz lodes. No one here pretends that they
are all Ophirs, Wide Wests, or Antelopes; but every third one will pay from $\$ 40$ to $\$ 60$ per tin in go'd.

> enumeration of some of the princtpal leads.

I will here mention the names of a few good lodes that are owned and worked by practical miners, viz. : The Minson, on the summit of Silver Hill, between Central avd Old Winwemucca, formerly known as the Eclipse, containing 400 feet in length and six in thickness with every indication of a rich lode, when more thoroughly prospected; the Lady Mack is another good lode and well defined, the length of the claim being about 800 feet, but, like many others, it requires more lahor to demonstrate its true value than has yet been expended uponit. The Utah and the Iowa are A, No. 1 lodes, (An'elope not excepted;) both being free from any entangled allegiance to any teighboring lade or spurs. The Dane lode is situated just half way between the two next above mentioned, and is one of the old locations, and from all appearances looks more promising than the Utah did a year ago. This lode is four feet thick, decomposed. and shows free gold. The Yreka, and many others on this hill will surely, before long, prove all if not more than the locators anticipated. The main Esmeralda and Silver Hill are also upon this Hill.
On Middle Hill, are the Pride of Esm eralda, Constantinople, Henry Clay, Live Oak, and Lady Howard, all well defined Todes.
On Last Chance hill is the Wyoming, which is one of the best lodes in the district. It was located on the 20th of October, 1860, and is situated between the Banuer and the Wide West, and directly on a line with the rich Jonston lode. This company is incorporated and has got evergthing in good shape through the pnterprise of their energetic President and Secretary, Peter Oppenheimer. The Blauchard lode, one hundred feet from the Johnston, in a southernly direction, struck excellent rock last week, and the owners ancicipate a "big thing." They have eight handred feet in their claim. The Joe Hooker, is another good lode ; one hundred feet in the claim, two and a-half feet in thickness. I may also add the Mammotb No. 1, Gen. Grant and the Ad Valorum, also the Pugh lode, located October 22nd, 1860, by John W. Pugh. This lode is at right angles with the hill and contains six clains of two hurdred feet each-they hare a shaft to the depth of some forty feet, at which point a rich vein of ore has been found. The well known Wide West is located on this hill, also the Garabaldi, Real del Monte, Alturas, and others.
A word about the extension of the Johnston. The 1st easterly extension of the Johnston has been struck at the depth of fifty feet-the rock is rich; it looks equally as well as the Wide West, and preparations are being made to take out one hundred tons of the rock to be worked. A large yield is looked for by the holdeas of this truly valuable mine. This extension was located on the same day as the discovery claim-the 3 d of July, 1862. Fisker \& Crooker and Parker \& Co. are the locators. They have eight hnodred
feet in the claim. The continuation of this lode was found
by Peter Johuston, the original discoverer of the Johnston
until he found the lode, for 100 feet of the ground. He was so fortuna e as to strike pood pay-rock at the depth of fifty feet. I shall hereafter continue, from time to time, to keep you posted as regards the merits and demerits of the minus and mining operations in this district, \&c.

## A New Mining Region.

A new and probably important mining region has been discovered in the western portion of Nebraska Territory. The discovery was made in September last by a party of some twenty miners, who were returning from the Bitter Root Valley Diggings, to Salt Lake. They cullected about $\$ 50,000$ in a few weeks, which they took to Salt Lake. This newly discovered mining district commences on Wind river, about 400 miles North-west from Fort Laramie, and embraces an area of about 200 miles in length by 100 in breadth. The deposirs discovered up to the present time are of gulch gold, very similar in apptarance and richness to those of the Feather river mines. It will assay at least $\$ 18$ to the ounce.
The region is the same as that described by Lieut. Reynolds, of the United States Topographical Engineers, in his report of 1859, in which he states that he discovered gold in all the streams embraced within a distance of some $200^{\circ}$ miles. It lies at the eastern base of the Rocky Mountains, and is similar in its geological formation to the Salmon river and Bitter Root Valley districts, where rich deposits of gold have been discovered within the past year. The miners who discovered these new diggings unite in the opinion that they will prove fully equal to uny ever discovered on the continent. The distance from Omaha to the Wind River Mountains, at the base of which the first discoveries were made, is tbout 900 miles. The route is all the way upon the north side of the Platte River, and no stream of any magnitude intervenes except the Loup Fork, which can readily be crossed any time during the spring and summer, by ferry.
Freight can be taken to the newly discovered mining region trom Omaha at 16 cents a pound. The South Pass of the Rocky Mountains is only about 200 miles from the mines, The facts given above are obtained from sources entirely reliable.

Tuf Ocean Steamers.-M. O. Roberts advertises the following vessels as belonging to his opposition line of steamers from New York to San Francisco: Illisois, 3,000 tons; Empire City, 2,000 tons; Moses T'aylor, 1,500 tons : America, 2,000 tons ; and the new steamship Bonaparte, 3,000 tons. The Moses Taylor sails on Wednesday, March 11th. The P. M. S. Line.-The Pacific Mail Steamship Company advertise the Constitution to sail on the 11th instant, and the St. Louis on the 21st. The Sonora sailed on the 31st ult. All the above, on both lines, are well built and eubstantial sea going steamers.

Precious Metals.-Thomson's Bank Note Reporter, New York, says there is more gold in the United States now by $\$ 30,000,000$ than there was before the war broke out.
the grass valley, nevada co. sit.ver mines.
The Grass Valley Nettional speake as follows of the silver mines opened near that town, last summer :-
Since the commew ement of the season of stornis, gene-ally so disastrous to the mining interest, the mines out at Greenhorn have, to a great extent tempararily abandoned operations. But there has not been a total abaundonment eveu during the time of storms, and considerable has been accomp'ish d during the past few montiss in demonstrating
the richness of the digrings at Greenhorn ; and the prospect the richness of the digryinus at Greenhorn; and the prospect
of heary expenditures of money in opeuing gold and silver ledges, during the approaeling spring, and a confiruntion of the opinion nuw oltaining, of the great wealth of this regrion. are confidently anticipated ly the people hereabont. In he Greenhorn Company, opened last fall, work is progressing satisfactorily. It will be remembered doubtless that a g goldbeariug quartz vein was opened last lial, the work being done in au open cut, and that the vein was traced but a few feet. yielding therefrom about $\$ 4,000$. A drain was dag from this cut, in the construction of which about ninety tons of quartz were taken out, all of which was crush d, making a handsome yield. A tunnel was subsequently run in to reach the main ledge, striking the vein at a distance of about sixty feet from the mouth of the tunnel, where tlie rock has a rich appearance In the stone wall Juckson claims adjoining the Greenhoru, work is being dune, the pro pects of success being highly flattering. Some work has also been done in the Buffilo, Hirrison, Jackson, and other silver leelges in the Greenhoru district, and when spring approaches, und fears of inclement weather are no longer entertained, we may confi

Nattonal Progrfss in T'uriray.-The Ottomans are fast becoming aroused to the importance of intellectual and material advancement. Of late years they have been sending out agents from their most experienced and intelligent men, to visit other countries and become aequainted with their methods and means of progress. That hitherto declining race is evidently profiting by their observations. Evidences of this are constantly accumulating; among the chief of which may b. noted the fact that an International Exhibi tion of the prodncts of the soil, and mechanical industry of that country is to be innugurated at Constantinople, on the 20th of the present month, to continue for three-months. Foreigners are invited to take part in the exhibition and compete for prizes. It seems that the shaking up of that old dynasty by its late encounter with Russia has galvanized real life into it. The "sick man" of Europe may now be considered convaleseent.
Inerease of Wealth.-The increase of the national wealth for the last decnde is set down in the census iu round numbers at $\$ 900,000,000$, of which about one-third was in States now in rebellion. The remaining $\$ 600,000,000$ consisted largely in the augmented value of real property, chiefly in the Western States. A tract of land in the distant uninhabited wildervess was of little value; but when by means of railroads and steam communications, an enterprising and industrious population were introduced, property advanced rapidly in value. The increase of Bank Capital during the decade was less than $\$ 200,000,000$, and of deposits in Banks $\$ 125,000,000$.
Gen. Surblds.-The military standing of this gentleman having recently passed under a cloud, he has wisely determined to resigu his position in the army and agaiu take personal eharge of his rich mines in Mexico.
There is another California General, we wot of, similarly siauated, who would probably be of quite as much serviee to himself and country by following the example of General S. Mining, when one has a rich claim tn operate upon, is far better to "put money in your purse" than fighting.
The Cartle Manta.--Five or six years ago nearly every one in California was crazy with the cattle speculation. It was said to be impossible to over do the business, and people could not well wait for the natural. inerease of Stock, but eattle were driven across the plains by thousands. The number in the State was then estimated at about one mil lion and their value at $\$ 30,000,000$. About the same number still remain, but their aggregate value has dwindled down to probably less than $\$ 10,000,000$. Several thousand head of cattle have been sold the past season, in Santa Barbara county, for from one dollar and a half to three dollars per
lead.
Cotron is now worth from 58 to 60 cenis per 加. Two jears ago it was dull at 18 to 14 ets.

Another Gigantic Project.
The present is most emphatically an "Era of Magnificent Futerprises." Thefinter-oceanic telegray ; the American Continental Railroad; the tunneling of the Alps and the Pyrenees, and the Suez Canal, would, either one of them, 20 yeurs ago, have been considered as a characterist c rok of the age. Now either one is so lost in the multiplicy, of projects, as searcely to attract any special consideration ; and the gigantic unde taking recently set on foot in Germany, scatcely second to either of the abure, is announced in a simple newspaper item, as among the trifles of the day. This last project is no 1 ss than a ship canal from Amsterdam, through North Holland, toward the Sea-to be 250 feet wide, 24 deep, and 13 miles long. When completed, it will shorten the distance from Amsterdan to Loudon and all the ports south of the Texel, hy abont 80 mites, so that vessels will then be enabled to reach the sea in a fow hours, whereas the present trip occup es several daysi, and sometimes weeks. In order to form a safe sea entrance to the canal it will be necessary to coustruct an artificial harbor, the piers of which will extend more than a milointo the sea. This will be the chiel eaginecring difficulty to be overcome. The tatal ca;ital r quired is estimited at $\$ 7,500,000$, upon which the Dutch Guvernment guarantee an interest of 41/2 per cent. The undertakers are J. G. Jager, of Amsterdam, and the Euglish Engineers, B. W. Croker and Chs. Burn. These gent'emrn have been ten years maturing this project, the grant having been originally asked in 1852.
"The Piysical Men of Onio."-The Commissioner of Statistics of the State of Ohio, in his aunual report, says :
Professor Hemry and myself have been several years engared in defing the American m.an, by accurate measureaccurately the men of Ohio. For this purpose he gives the measurements of three hundred farmers, miners, and laborers, in eleven vilages; of two hundred and thirty others, in eleven vilages ; and five companies of Kenney's cavalryall native Americans. The following appears to be the geceral results of these meesurements : That the man of Ohio is five feet nine and one-third inches high, and is taller than any European nation of which there are measurements. He is taller than the Belgian, by several inches; than the Eng-
lish, and evert the Scotch Highlanders. I'he Highlanders, lish, and even the Scotch Highlanders. I'ke Highlanders,
bowever, exceed the Americans around the chest, and are, on the whele, the stoutest. In complexion, eyes, and hair. the light predominates over the dark. The prevailing hair is brown, and the prevailing eyes gr, $y$ or blue. In one word the native American is a modified German of the time o T'acitus, and such he ought to be from his antecedeats.

Selling Children in Caina.-The Esperance, of Nancy, publishes the following particulars respecting the proceedings of the Sainte Enfrance, in China, exiracted from a letter written by a lady, a native of Nancy, at present residing in Fong Kung:-
All that you have heard about Chinese children is but too true. I'hey are not, indeed, given to pigs here, but that is the case further in the interior. At Hong Kong mothers come to the asylum of the Sainte Enfance and offer their children for sale, as I myself saw ouly a day or tro ago. I have just visited this asylum, kept by the nuns of St. Paul, whose principal establishment is at Chartres. While I was there the bell rang, a nun went to open it, and returned in an instant after with a female infant only a few days old. The price paid was 200 sapelss; but the mother, a hideous creaure, wanted more, or else to have the child's clothes returned, which were accordingly given to her. The nuns told me that there were women who carried on quite a trade in these poor babes. One. had brought no les: than forty to the asylum, and she confessed that before she had the opportunity of selling them, she had thrown above six hundred in-
to the sea. I mast tell you that I stood to the sea. I minst tell you that I styod godmother to the
poor thing purchased in my presence. The great cause of poor thing purchased in my presence. The great cause of and marry again every yeur. The divorced wives, according to the Chinese laws, have the right of life and death over their children, and if unable or anwilling to rear them they get rid of them in any way they choose.

The State Almanac and Hand-Boor of Statistics.
We have rec-ived of Henry G. Langley, of Directory fame, neat Hand-Book Almanac, containing various items of interest of both State and Country. Long may the Publisher live to direct the foot-steps of our citizens.

Coinage.- The amount of gold coined at the San Francisco Mint, for 1862 , was $\$ 33,042,841$-of silvcr $\$ 1,205,698$.

Muxificent Donarfon.-We see it stated in the daily papers that Harvey S. Brown, Frag., has donated to the City College, now a flourishing institution of 125 pupils, the princly sum of $\$ 50,000$ in cash and twen $y$ acres of ground, on what is known as "University Mound," on his Bernal Heights property, snme five miles aut of the city, on the San Jose road. 'This gift is none the less genuine, or positive, by reason of its beins coupled with certain conditions of land sales, bucause those sales are such as the natural and inerit ble growth of the city, in that direction, must bring about in a very short time. The donation is effective so soon as Mr. Brown shatl have disposed of five hundred lots in the aforesaid tract, at $\$ 200$ each. The proceeds of one half of each lot are to gu directly inte the hands of the Crustees, as a fu $d$, until the required number of lots are sold and the $\$ 50,000$ accumulated. Heary H. Haight, Thomas H. Selby, James D. Tlarnton Dr. H. P. Coon, H. M. Newhall, F. Henderson, and other prominent citizens, have each already secured a number of these lots, which are beautiful in point of location, and toward which the city is rapidly extending. The streets on this tract are alre dy laid out, and are named after the principal colleges of the East, viz: Yale, Harvard, Dartmouth, Princeton, etc., while the cross streuts are called alter the most eminent college professors, such as Alexander, Mofit, etc. When located on University Mound, which it doubtless soon will be, it will be known as the University College.

The Hesperian for February is at hand, and is an unusually interesting number. Besides the usual patteris and pattern outlines, it also contains the representations of two of California's flora-the "Tiny Petunia," and the "Purple Wedge-spotted Evening Primrose." The descriptions are by Dr. A. Kelloga, who has done much, through the columns of the Hesporian; to spread before the world some of the beautiful and rare floral productions of our golden State. It is true, as the Doctor beautifully remarks "We owe the world something in return for the spread of their own local knowledge-oft-times of increasing interest as it reverberates upon a distant shore. The commonest objects to us; are new somewhere; the most trifing incidents from our heart's love, are the fragrant flowers along, our path."

The Rising of Springs and Streams, in California, before the Winter Rains," by Dr. Henky Gibbons, is a very interesting and valuable paper, which we intend to transfer to our columns. "The Golden Wedding" is another interesting paper, nad will carry many a heart in California, back to the "Old Folks at Home," as the unbidden tear moistens the eyes which read the accuunt of this "golden wedding" in the far off Eastern State of Maine.

Shooring Molten Iron-This process consists of a hollow shot of any given caliber, with a round hole or fuse in its side ; on the sides of this fuse are two parallel raised lines, grooved on the inner under sides of them, into which to slide a piece of wrought iron to clean the fuse when the shell is filled. The inside of the shell must be coated with some subsisfance, to prevent the molten iron from coming into contact with the iron of the shell. The shell can be fitted to any sized gun ; when filled with molten iron it has the weight and form of a cold ball; when it strikes a solid body it will burst and the molten iron is a thousand times more destructive than a hot shot.

Territorial Enterprise.-We are under many obliga tions to the 'Cerritorial Enterprise, published at Virginia City, N. Te, for its daily supply of mining intelligence, from that important locality. The Enterprise is evidently a live institution, and will, we trust, long continue to occupy the foremost position umong the journals on the Eastern Slope. We now and then miss receiving a number, which would be very annoying, were it not that we can always find access to its files at the Agency room of Mr. Thomas Boyce, corner of Sacramento and Montgomery, St. Mr. B. is the San Francisco Agent for this paper, and receives subscriptions and advertisements for the same.

The news from the Colorado mines is very encourageng. $\$ 100$ per foot has been offered in Los Angeles for 50 ft . iu the Los Angeles Lode, (Colorado Dis.) Fifty feet sold is this city, on the 29 th ult for $\$ 250$.

## MINING AND SCIENTIFIC PRESS.

## askensment sales of mining stock.

Sales of Stoch for non paymeut of assessments are adver tised to bo sold as follows :-

Cole Silver Mining C'o.-Sales by Jerome Rice \& Co., 327. Muntgonery St., San F'rancisco, on the 25th of February.

Combination fr. \& S. Miniug Co.-Sale by F. S. Spear \& ('o., at 433 C'alifurnia St., ou the 10th day of March wext. - Normon S. M. Co.-Sale hy John Middleton \& Son, 40 Montgomery Block, on F'eb. 16.

## company mbetings.

The Lewis G. \& S. Mining Co.-Annual Meeting will be held at 622 Merchant St., Feb. 12, for election of officers. Ida (1. \& S. Mining Co.-A Meeting of Stockholders will lee held at 522 Mantgomery St., Sau Francisco, February lith.

Burning Moscow.-Shares of this Company, in arrears for assessments will be sold at nuction, Feb. 9.
Baltimore America Cunsulilated.-Anassessment of 50 cents per share was levied, Jan. $\overline{5}$.
savage.-An assessment of \$35 cents per share was levied, Јаи. 7.

Hawley. - An-assessment of 25 cts. per share was levied Jau. 5, payable in 30 days.

Cole S. M. C $\%$ - An assessment of One Dollar per share was levied, Jan. 10, payable, Feb. 1.
United Sitates M. Co.-An assessment of six and twothirds ets. per share was levied Jan. 10, 1863, payable to the Superintendent at the mine, or to the Secretary, Rooms 7 and 8 , Guvernment 1louse, Fian Fraucisco.

Sierra Nevadi S. M. ('o. levied an assessment of $\$ 15$ per share, Jan. 15-payable Feb. 18.

Lady Bryan.-An assessment of 70 cts. was levied, Jan. 13, payahle on or before Fel). 16.
Ida G. \&S. Co. (Russ District)-An assessment of $\$ 1$ was levied, Jan. 14.
Henry Martin G. \& S. M. Co--"Thomas Wallace, Trustoe." gives notice that whereas certain parties illegally claiming to be Trustees of this Company, have changed the name of the Corporation to the North Star G. \& S. M. Co., and illegally elected officers tor the same, the public are cautioned apainst such acts, etc.

Red, White and Blue G. \& S. M. Co. levied an assessment of 25 e nts per share, payable on or before Feb. Ist, office cor. Pine and Montgomery Sts.

Live Oak Copper Co.-The Annual Meeting of Stockholders for election of Trustees, will be held at Office, in Mantgomery Block, Feb. 2, 1863.

Coso Silver Mining Co.-The Office of this Company has been removed fiom the Steverson House to Nos. 11 and 13 Court Block, No. 636 Clay street between Moutgomery and Kearny. Entrance on both Clay and Merchant streets.

Mina Prieta S. M. Co.-An assessment of $\$ 10$ per share was levied, Dec. 26, 1862 -payable at office, cor. Montgomery and Jackson Sts., on or before Jan. 26, 1863.

Franco-Americano S. M. Cn.-The following persons were elected officers at the meeting of trnstees, Dec. 26 th Chas. F. Gaian, President and A. S. Gould, Secretary.
The office of this Company has been removed to No 528, Cluy street, Room No. 2.

Central Silver Mining Co.-The Annual Meeting for the election of Trustees will be held Jan. 13, at Office, No. 712, Montgomery street.

Lady Bryan (i. \& S. M. Co.-Shares of delinqu nt stockhroblers will be sold at auction for asseusuments, at No. 400 , Montgomery steet, on Jan, 27 .

Desert Mining $\mathrm{r}_{\mathrm{n}}$.-Shares of lelinquent stockholders will be sold at auction, for nssessments, at No. 400, Montgomery street, Jan. 27.

Keyst ne C'opper Mining Co, advertise for prepozals to purchase or treat 3il quality copper ore. Proposals received till Jan. 15th.
Ifale \& Norcross S. M. Co. hare levied an assessment of $\$ 5$ per share payable on or befure Jan. 26 th.

## WASHOE MINING NOTICES.

Martin White.-An assesement of 20 ets. a share was levied, Jan. 2.
Orieutal G. \& S. M. Co.-An assessment of 50 cts, per share was levied. Jan. 14. payable at Office, cor. Sutton Arenue and O St., Virginia Cits.
Normon S. M. Co.- Mifldeton \& Sons, No. 40, MontMomery Block, will sell delinquent stock of this Company, F'ebruary 16 th.
Baltic Mining Co - Notice is eiven of an adjourned sale of shares in this Company, to take place on the ground, Jan. 31st.
Caution.-D. M. Tyrell warns persons against purchasing a certain 10 feet of ground in the Wellington Co., standing in the name of J. B. Magce-also 20 fect, standing in name of W. Williams. (See 'I'erritorial Ente prise.)
A shland Co.-I. A. Gould, in the name of the Moss Co. notities the Ashland Co. that their westerly drift has cut the Lambledge, in the Moss Co.'s ground, from which the Ashland Co . is forbidden to extract any valuable metals.
Eldorado G. \& S. M. Co,-An assessment of one dollar per ehare was levied, Ded. 31, 1862; payable, Jun. 22, 1863, to the Secre'ary, at corner of Montgomery and California streets, or to the Superintendent at Virginia City.
Texas Co.-Tennessee Ledge. - An assessment of 25 cts per foot was levied, Dec. 22, payable on or before Jan. 21 1863.

The North American Co., Gold Mill, will sell at auction
Jan. 31, stock of shareholders delinqueut in payment of sesaments.
Martin Wilite Minina Compant.-An assessment of teu oents per foot has been levied, payable to the Secretary, at cffice on C Street, Virginia City,

The Sweeney Co., Gold Fill, give notice that Baltic Company lave wrongfuly claimed and worlsed their ground since July, 1860.
The Chmafy Rock Co., lying next west of the Virginia Co. claims have notified the Hazel Green, Tingley and Brach \& Paxton Companys that they are tresspassing upon the Chimney Rock Co's ground..

## esmeralda mining notices.

Tre Zenobia Lode Company, give notice that they claim a saperior title to the Johnson Co., cl. iming the ame ground, so far as said localities conflict. This ground is a portion of that now held by the Conpany known as the Wide West Company. The notice is signed by A. Waddell, J.C. Dorsey, S. P. Dorsa y and James Eiluer,

Ore Tests.-Several inquiries have been made to us of the different chemical tests that will discover traces of silver and copper in the rock. If our friends who are conv, $r$ sant with this matter will forward, information respecting such chemical tests to us, we will be happy to give them publicity. [Amador Ledger.

Persons interested in the above will find the desired information, and much more in the same connection, all valuable to copper and silver prospectors, in late numbers of this paper. A remittance of six months or a years subscription to the Mining and Scientific Press, will afford them all the valuable information obtainable from books in relation to prospecting for either silver or copper, and assaying and testing ores of the same. The dissemination of that class of information is the speciality to which this paper is devoted, and no mineral prospector in the silver and copper regions of California can invest $\$ 4$ to better advantage than by seuding the same to this office and becoming a subscriber and reader of the Press. We shall be extrem'ely happy to receive the oames of all who may favor us with cash patronage. We also pledge oưfelves at the expiration of the year to refund to any party double the amount of his subscription, who may honestly think he has not got the worth of his money in valuable information from our columns.

Subscribe,-A Are you a miner and not a subscriber to the Mining and Scientific P're-s? If so. you are an anuual loser of many times the price of a year's sabecription, particularly if you are engaged in quartz mining. The same amount of practical information, important to miners and mechanies, which is contained in a valume of the l'ress, cannot be bought from the shelves of any bookstore in the country for the price of several year's subscription. Ho you ever send a paper to the "Old Folks at Howe?" If so, and you desire to send important information and valuahle reading matter, you can find no papr that will be read with so unch eagerness by lhem, or one that will convey to them so full an account of the real industry of the country as the Mining and Sciextrit Prass. We invite all to send us their uames and four doller's, or lun dollar: for six months, and become patrons of the only mining pr per printed on the Pacific coast. Those who receive a paper with this paragraph marked may understand that it is sent to them for exanmination, and with the hope that it may so for meet with their approval as to wurrant their subscribing for it at once. It is not our usual custom to receive a sulscriber for less than six months; but inasmuch as we are anxious to introduce the paper where it is not now known, we will, for the pre-ent, send the Press for three months even, on the rece'pt of one dollar, in coin or staups. It is our belief that no one will wish to discontue the paper after being a constant reader of it for even that short period.

An 1mpertal City.--The annual expenditures of New York City are $\$ 20,000,000$.

Stlper in Nova Scotia.-A letter from Nova Scotia states that, in prospecting for gold in the northern and eastern portions of the province, the writer found silver, as well as gold, in great abundance ; that in every panful of earth washed from the stream he found pure metal: and veins of spar containing native silver traverse the mountains on each side of the river, and are exposed at some points along the sea-shore.

## MINING AND SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICL AND SCLENTJFIC PAPER ON THIS CONTINENT.

## THIRD YEAR: VOLUME VI.-NETV SERIES:

A 11 ww volumo of this extenswely circulnted parer commonced Sept. Il, 1862. It is mitenden that urery number shan ter eplete with infornation with sermal original engraviuls, of new inventions, etce., grepared expressly
for it for its collingis.
This mpyer is devoted to the above purpusex, together with the interests of ©cience, Arts, Ayriculture and Commerere, and any geural information
that may be of inturest to the reader: and it is the intrntion of the praprie. tor tosture no painas or explecise in making it equal in interest and valuable informition to any paper yet publisled.

The Mining Interest !
 athped to tant plurliose, aud of every thing generally that may bu wisurvice to tho 3inor.

## The Inventor !

 ain Yatents with disp)atch.

## The Mechanic and Manufacturer :

Will be greatly bencittod by its peruani, as ench number will contan sorcral origimal enyravings of new machines and inventions, together with a
large amount of readiak matter apprytaining: flece to. We are constantly
 shall continue to extract whatever may bo ol benefit or interest to our readers.
To Chemists, Architects, Millwrights and Farmers!
This jouraal will bo iuvaluable. All new discoveries in chemistry will bo
 Millwrights will be found in our culumins. The Farmers and Plantrers will oot be neqlecten, engrarings will will he auply discussed.

Terms.
To mall subscribers:-Four Nollars ner annum.
Clab Nates.
Club Rates.
Five Copies for Six Month,s. \$8.
Ten Copies for Twelve Months, $\$ 30$.
Mifteen Copies for Twelve Monthe, $\$ 44$.
Twenty Copies for Twelvo Montlis, $\$ 56$.
For all clubs of Twenty and over, the yearly subserintion is only $\$ 280$ Names ean be sent in at different times and trom different
Specimen copies will be sent gratis to any part of the country.

## To Printers.

An Laterest in one of the mast lunushug and best paying Newspa por Offers in the momitans is ultered for sale nu easy terms. A rare op poltunty is hereby presented to any priuter destrons of e: cablimhing him self is a gnod husiness in one of the healthiust, must thriving and delight ful monutain towns in tho state. For further information euquire at this ofice.

## NOT SO VERY STRANGE.

Much astonishment has been expressed of late, that the immense dep.sits of copper ore now so rapidly being developed in vearly every mining section of the Stute should have remained undiseovered until th" pr:sent time. It is also a puzzle, "strange at least," in the estimation of ove of our mountain contemporaries that -during an excitement of gold discoveries" "we seldom hear of any deposit or vein being found which does not contain gold; while a similar order of things may be noticed during silver, copper, or other excitemen's."
These things are not so very strange, after all, when we come to reflect upon the lack, among our miners, of that particular class of information so essential to the correct understanding of their calling. Who that has spent any time in the mines, especially during the period prior to the Washoe excitement has not noticed, as a fact, most prominentiy developed, that miners of those days esteemed a knowledge of mineralogy and geology a: of very little ac count, "especially in Califorvia," where, they said, "all preestablished rules of mineralogical science are found at fault." The practical miners of California, of the last decade, almost universally regarded with smiles of derision, the aice discriminations and distinctions of the mineralogist. They were looked upon as airy nothings, fit only for cabinet studies, and entirely without practical value in the mining field.

We would not be understood as underrating the general intelligence of California miners; for a residence of more than twelve years among them, a large portion of the time a sharer of their toils and privations, has fully taught us the fact that the world cannot produce their equal, as a class, in that ruspect.
So far as-mining for gold is concsrned, it is true there is comparatively little need of the particular information of which we are speaking; for gold working is the sinplest of all miniog operations ever undertaken. But recent developments have fully established the fact, which is now coming to be universally acknowledged, that, every operative miner, in whatever field, should be thoro ghly acquanted with the nature of the substances upon which he is daily working, or which may, fortutiously, come in his way. Such knowledge should not be confined exclasively to the overseer, or superintendent.
A very slight knowledge of mineralogy would have taught the original owners of the Comstock ledge, to have carefully examined, "the troublesome black stuff," as they termed it, which was all the time in their way while they were searching for gold in the richest silver lead now known to the world. So it has been in hundreds of instances, al. over the State. Many rich silver leads are oow heing opened on the Western Slope, which were abandoned years ago, as worthless, because they did not show the color of gold. So it has been with the more recently discovered leads of copper, in various portions of the State.

Our mountain contemporay, already alludtd to, thinks i
"sirange at least," that the excitements should run in such direct lines-that is; that the discoveries of one period should be all gold, and another all silver, aud another still all copper, etc. Not at all, and from the very reason already nained.

After the Washoe excitement hod proved a reality, "specimens' from that locality were sent into every section of the State, and miners began to run hither and yonder, in search of old abandoned claims, which they recollected had presented similar "indications" to those of the Washoe specimens. Editors thronghout the Siate also rummaged over their old books, and printed long essays on silver mining, silver ore tests, etc. Of course the discoveries then made were chiefly silver. What did the miners know about copper? Bye and bye, somebody who had paid a little attention to mineralogy, casually stumbled upon some copper ore -knew its value, and commenced developing it. It proved valuable. Capitalists and Scientific men went ont to the mines, examined them thoronghly, were satisfied of their value and backed up their knowledge by the reidy cash, paid in hand to the miner for his copper ore. A new idea is evolved-new at least to the Califurnia miner-"copper specimens" begin to travel around. Another search is inade for "old diggings ;" "indications" are com ared; the newspapers publish descriptions of the diferent kinds of copper ore, with directions for tests, assays, etc., and lo! a copper excitement comes up. Nothing strange, is it, that all the discoveries "about these days," should be of copper ?
Our miners are gradually learaing the lessons, the ntility of which they swiled derisively upon a few years since. Bye and bye, they will become very good mineralogists and geologists. But they are learaing these lessons very slowly, and huvdreds among them are losing fortumes, by wating for the knowledge to come to them, when they should go after the knowledge. It should be recol ected that there are many other lessons yet to learn. Gold, silver and copper constitu e but a portion, and we fully believe, even when taken collectively, but the smaller portion of the mineral wealth of Catiformia.
Lest our readers may think that we esteem the mineral knowledge of Californians below the average standard of other cuutries, we will relieve them of any such impression by the following extract, illustrutive of the mineral knowledge, up to a very late period, in a country where mining is now carried on to an extent and with a scientific knowledge nowhere else observed. I'he extract was written for the "OALifornia Mining Journal," published by us three or four years since :-
Sume of the mining districts of Great Britain are utterly destitute of mineralugical education, and it is common to find sume of the most intelligeat miners only acquainted with one or two substances, which are brought prominently before them ia he routine of their employment.
It is a fuct that for sume years lime was expurted to New south Wale-, where it existed in abunda.ice in its natural state, and it is notorious that the discovery of gold in Australia was not made till after it was found in this country.
Cornwall, although it has been celebrated for its tin mives from the earliest periods of history, yet, until the last century the ores of copper were used to repair the roads, and whenever copper appeared in a vein, it was a common expressiun that "the ore came in and spoilt the vein," [just as the "black stuff" did in the Comstock lead, we suppose. Ed. Press.] Even wh a the yellow ore or copper pyrites had been long appreciated, the sulphide of copper was
thrown away, and the rich black ore, or oside of copper, was washed into the rivers.
In Derbyshire and Cumberland, although it is indisputable that lead has been smelted from the common blue ore, (sulphuret of lead) ever since the goveroment of the Romans, yet the other ores of the same metal (white carbonates of lead, \&e..) w.re never thought of, but left in heaps as rub-bi-li-the public roads which had in some instances been repired with hese rejected eres, have been taken up and smelted to good account.. The ores of zinc, both sulphurets and carbonate, were likewise thrown away in many of the mining districts of England until within the last few years. Blend has been mistaken for lead ore, and a blast hearth erected to reduce it, and in an ther case from its resemblance to a certain iron ore, a considerable quantity was bought and couveyed to one of the largest iron works in South Wales. The collection of a series of iron ores from the great London Exhibition of 1851 led to the important discovery that the road into Northampton had been cut through rich iron ore, which in some plaees had a thickness of twelve feet. Then they were iguorant of its value, bat now it is being sent in jmmense quantities to supply the Staffordshire iron works.
So much having been overlooked in a country densely pop-
ulated like Great Britain whose mines now yield on an av erage about $£ 30,000,000$ per annum, it is reasonable to conclude that important discoveries will yet be made in this State.
The last paragraph is most enuphatically prophetic, and fully demonstrative of the certainty with which acculiate science leads to definite results. We may here, mention that the writer of the above extract, was the sume gentleman who first assayed the Comstock sulver ore nnd inrroduced to our people a mineral region to which California, with all her acknowledged mineral wealth, is but the stepping stone, in comparison.

Nautical Magazinf.- We have received the February number of this valuable publication. It is, as usual, replete with new and valuable ma ter appropriate to a magazine devoted to nautical science in general and the comuercial interest of the Pacific Coast in particular. I'his publication is highly creditable to the important interest which it represents, and we know of no other man, between the two oceans who is so well calculated to conduct such a work as Capr Berd-be is emphatically "the right man in the right place," and we trust he may long be spared to fill it

Capt Bell is a man, who, font his youth ap, has been ardently and earnestly devoted to the great and good work of elevating to their proper standard the character and profession of the sailor, and it is a matter of sincere congratulation that the commercial interest of this city has joined hands with him so earnestly in the work. As an important meaus for the accomplishment of the resired end, a large number of the leading ship-owners, merchants, shipmasters, aud marine underwriters of this city have joined with Capt Bell, in a memorial to the Legislature a-king for the establishment of a Board of Nrutical Education and a Mapin school Ship for this barbor. The importance of such a project in an isolated commercial emporium who e rapid prospective growth is so manifest as that of San Francisco, can scarcely be estimated ; and our Senators and Reןresentatives, now assembled, will greatly neglect the interest of their coustituents in this city, and indirectly of the entire State, if they fail to take the iuitiatory steps toward grant ing the memorial above alluded to.

A Valuable Tract of Countiry.-The value of the oil thus far obtained from the Venango, Pa. oil region is estimated at $\$ 4000,000$, yet the producing territory is but some eight miles long, with an average width of less than forty ruds. There appears to be no present prospect of dimuoition in the yield.

Ncrtu Pactpic Review - We have received the February number of this excellent periodical. It is illustraced with a well executed and life-like portrait of Brig. Gen Wright, the Federal Commander of this District. Its literary treasures are bright and sparkling and fully up to the staudard of first class magazine literature.

## NEVADA COUNTY STOCK REPORT.

## [Cumileed frga tae Nbvida bemocrat]

Under date of Junary 31at, the Report of the Democrat eays: "Tho acwity in eoppor speculations, heretufure notel, still continues, and quite a umber of sales have been elfectud, mostly ou private terms. Two shares a the Scarls Capper Mue were sold yesterday for $\$ 100$ enctu-being at the rate of one dolliar per tuot. The clamsof this Compauy are located ou the maiu lead, uear tiso Zinc Louse. A number of orgauized compantes are eu guged in opoding their leads and testang their orts. Specmetus of oru frow Beldwin's lead, vear'Mclarty's Ranch, assay very rach-mo one iustauce a highan 30 per cent. The company owniug this lead is kouwn as the "Consols" Compauy
Prospecting for copper is stall beiur carried on vigorously. A site of 20 feet in the Well lead was tilected on the 28 st ult, at the rate of $\$ 20$ per foot. aud 100 feet in the Champion Company's Lead chaged handsat fifty cents

Dius Pailre was quoted on Tuesday at $\$ 40$ ，on Wedvesdsy at 30 and on Fri－ day at $37 \%$

## San Francesco，February 0lh， 1863.

## STOCK REMARKS

The busincss of the past week has boen mostly confined to socond and third cluss stucks．Ophir and Gould \＆Curry bave been but littie deal in．These stocks seem to have been pretty much withdrawn from the mar－ ket．The amount of busiaces for the werk bas been harge，and at prices very cultsiderably in advaluce of previnus rates．
Ophir has been in steady dem and，$a t$ ；bout last week＇s priees，but with a limitudsupply．Bids，on Friday and satu rday had materially mproved． A divident of $\$ 88$ per fint was teclared on Friday；payible to day．This dividend exceeds the expectations of stockholders．
Gould \＆Cucry hasalso been very quiet during th
stock offering．Prices at about lavt week＇s quetations．
Strage is a But litho atoll a favorite，haviug advanced abolit $\$ 300$ during the week． are generally condeut that this mine will soon prove itself equal to the Dest in Virginia．
Chollar is sill improving，having advanced fully $\$ 200$ since last week The 1 ag witheld decision in jts suit with the Potosi，seems to bo operating In its favor．White its friends are firm in the belief of a still further ad． vance，others lonk as confidently for a speedy deche．The reant of the Inwsuit is still unxiousty awaited，and the＂laws delay＂most severely com－ plainol of by some．
The Potosi decliaes at about the same ratio with the advauce of the Chullar．A lew simple words frum the seat of justice may，at ady moment reverse the order of procussion
Charles Canuy．－The suck of this Company has taken a most remarkable upward tendoncy during the past week，and now，stands at one hundred per cent．in aivance ur its figures one weck since．We are botudvised of the cause of this udvance unless it be a change in the management at the mine， which we believe has been offected within a sbort time．
Sierra Nevala las been somewhat fluctuating，advancing from $\$ 00$ to $\$ 70$ and again recedus to $\$ 62$

## WASHOE STOCK RENAREE

［Complasi troak thik Daht Tsiritorial Emterphar．］
Wo infer from the＂Reaports＂of the Territorial Enterprimo that transact ions 1 m mining ntocks in Virgitian City，furlug the week of the market rep－ resented in our insue of to－day，lave manfested un alr of unusual prosperi－ ly－greater than for any similar period nince hitat summor or tall．Consifo－ rable demand has cxisted，during the week，for outside clama，nomo of which have heretofore bot becu taquired for，and were unanleable utapy wrice．There itsit appeara to be quite a demand for mont of tho prumineat clums in the market，at very topportaut meances，As ynt，howover，opo－ r thons arb ctietly conbued within the muans of small capiulists，and，as a consequeuce，trunactiong are light．The demaud for bome clatims greatly exceeta the ineliumbun to sett，ut prosemt rates．The general dispuastion on the jart of buyers appears to be to purchane clajms which bave provon goout，oven with a peuding lawsult，rather than to chanco an unduvoloped sinu．We append tho trausactious and rates of the week，up to tho tatess dates roceived．

## Tursday Evering，January 27.

Accounts from Palmyra are not bo encouraging as to the extent of the mines in thit licatity，althorbta rec ut devolopments milleate the exiatence of several elatins of undoubtud cichauess．The Beweh－l＇axton Co．are now tasimg out rock of much better，utlity than when near the surface．
Sovera 1 ummpurtant bales buvo ubseu placo wo day．
Wedresday Eviming，January 28th．
Flowery Hill is being talked fato some favor．No ledgo has yot been dis． cuvered，but thiry dayz，it is chamed，will solve the problens，
There lian bero cobsilerable iffe in the stnck market，to－dny－much bans hering，much myster y，much quiel ixcitement，but few positive kales．
Thicre bis been sume dulziny for Hazel Grwen at current ratex，and Shc ramento is faught fur al 60 © 65．Welloghton is alsu in demand at our fig ures of yesterday．Wi h these exceptious，which iudicate something of an advance at the atucks anmed，we have no importatht changes to note in our last quotations．

Thursday Evening，January 20th．
Greater activity is manifested in mining stocks，to day that has been no－ ticul for several weeks previuus．Cuasiderable demand is made for out． side claims，sume of which bave not herelofore had a market value，uud were uasalenble at any price．
The Dunn Company＇s atock is in good request at $\$ 4$（3） 5 per font．The clams are suid to present much better quallty of rock as depth is attion－ ed ut the ledige．
Twenty fuet of Hazal Green sold at $\$ 3 / 3$ per font．This stock bas very much depreciated in the market．The itpprarauce of the claims judie．te that a higher figu＇e might be puid with a gond show of suecess for the buyer． Ychow Jucket is in demand at $\$ 100$ per fuel．There appears to be a great－ or disposition on the part of buyers to purchase claims which have proven good，with a pendiug lawsuit，thau to chance a muse undeveluired．
Tweuty feel of the Uatou suld，to diay for $\$ 1212$ ．Teu fuet of Birdsall sold at 20 dultars per foot．Several other sules were consummated，the terms of which are kept private．

## Friday Evening，January 30th．

Teu feet of Sacrumento sold at $\$ 55 \mathrm{per}$ fivh．Nerth Putusi is euquired for at market fites，Jeytohia is enquired for．Ten feet of Birdsall suld fur 20 dollare por fuot．Finty feot or Wellington suld at privalu rates．Twenty feet of Simaloa are regorted to have changed haude at 37 per foot

## Saturday Evianine，Jubuary 31st．

Sacramento is in demand at $\$ 55$ per foot； 30 feet chauged bands at these rates．Yellow Jucket is inquited lor at 110 doliars per fout，aud can be sold at theso figures in lots to suit the seller．＇This cumpuny are taking a large amount of rock from their mius，which，we are intormell，is readily sold at elght dollars jor tou at the dump．The Coppers aud Mills Compuay are tak－ ing some very rich rock from their clunns，resembling the best found in Gold hill．We are not advised as to the quantity of this sind of ore，but presume it is of great extent，bewg the Northern exteusion of the Gold Hill Ledge．Waterhouse is enquired for at 3 名 per foot；Gay at 23／2． El Duralo is quict，beld at 60 dellars，withuat sales．Birdsall is held at from 223 to 25 －iun feet changed hands at 20 ，und finds ready sale at the later ligure．Hazel Green is olfered at $\$ 4$ per foot，but thete is no demand for the stock．IJock was exhibited today，takeu from the Uriental claims，which had tho appearance of beig tich in silver．The rock was from a emall vein verging to the ledge．The Compauy expect to strike the maia ledge within 20 leet or this puiat．
La Crusse is oftered at $\$ 17$ per foot．Wellington is inquired for．Several small sules have taken plate in Gold Hill stocks．Claims in this district are ill genoral demaud aud during the summer will probably cummand high figures in locutions nut at alt promiatut an the markut at preseut．

Monday，Felb．2， 1063.
There has been leas buying in claims to－day thill usual，though not without apparent ucliuntion on the part of those desirous to iuvert．Pres－ ont bolders seem determined on domanding an advance on the current rutes，while the would be－purchasors neem disposed to doubt the propriuty ol stakding the rise．
There has beon considerable demand during the past few days for mition． Fifly feet，we are infurmed，suld to day at $\$ 60$ yer fuut．
Several luts of stock are ofrered for sale tw－day frum Flowery District．． There appears to be no dematud for clams ill the Jocality．Uperatious in these mues have gerertully froven uusuccusstul．
Therv contunes to be some dumund Lur Duna stock．Sovera！unimportant sales labve been eifected iustocky iu Virgiuma aud tiold Bill Districhs．

## SUGGESTIUNS ABOUT FOREIGN PATENTS.

American inventors should bear in mind that, as a general rule, any invention which is valuable to the patentee in this country, is worth equally as much in Eogland and some other foreign countries. Four pateuts-American. English,French and Belgian-will secure an inventor exclusive monoply to his discovery among gne hundred millions of the most intelligent people in the world.
The facilities of business and steam communication are such, that patents can be obtained abroad almost as easy as at home. The majority of a'l patents taken out by Ameri cans in foreign countries are obtained tbrough the Mining and Scientific Press Patent Agenct. Having establish ed agencies at all the principal European seats of Govero ment, we obtain patents in Great Britain, France, Belgium Prussia, Austria, Spain, ete., with promptness aud dis patch.

Models are not required in any European country, but the utmost care and experience is necessary in the preparation o the specifications and drawingse

When parties intend to tak out foreign patents, engravings should not be publishet until the foreign applications have been made.
Cadtron.-It has become a somewhat common practice for agents located in England to send out circulars soliciting the patronage of American inventors, We caution the latter against heeding such applications as they may otherwise fall into the hands of irresponsible parties, and thus be defrauded of their rights. It is much better for inventors to entrust their cases to the care of a competent, reliable agent a home.

While it is true of Most Eurupean comntries that the system of examination is not so rigid as that practiced in this country, yet it is vastly important that inventors should have their papers prepared only by the most competent solicitors in order that they may stand the test of a searching legal ex, amination; as it is a common practice when a patentee finds a purchuser for his invention, for the latter to cause such examination to be made before be will except the title.
It is also very unsafe to intrust a valuable invention to any other than a solicitor of known integrity and ability. Inventors should beware of speculators, whether in the guise of
patent agents or patent brokers, as they cannot ordinarily be patent agents or patent brokers, a
trusted with valuable inventions.

## Onr Mint. its Rules, Charges and Operations.

In the columns of a contemporary we observe some ex ceedngly interesting statistics of mint matters for many years past, from which we glean the facts that the legal limit of wastage was $\$ 207,76699$ for the three years ending
April, 1857 , while the actual loss was $\$ 266,31286$, exceedApril, 1857 , while the actual loss was $\$ 266,31286$, exceed-
ing the limit some sixty thousand dollars. During the four years of Mr. Hempstead's Superinteedency, the legal limit was $\$ 235,38639$; while the actual lost was only $\$ 4,52035$ being some $\$ 230,000$ less than the limit, and, in fact, a little under two per cent. of the amount allowed by law to be wasted. The wastage of the Philadelphia mint is twenty-
two per cent., against two per cent., wasted by our branch two per cent., against two per cent., wasted by our branch Birdsall \& Lott, amounted to the large sum of $\$ 1.019,275$ 39. Under. Mr. Hempstead, the total expenditures for four years were but $\$ 1,150,64814$; while the difference between the last year of Judge Lott and the last vear of Mr. Hem-
stead was upward of $\$ 100.000$ in favor of the latter. On stead was upward of $\$ 100.000$ in favor of the latter. On
retiring from the Saperintendeacy, Mr. Hemstead left an nuexpended balance of appropriation due the mint of up wards of $\$ 86,000$. This certainly is a capital showing for our mint, and speaks well for Mr. Hemspstead's Superin teadency. Under Mr. Stevens, the present Superintendent. we have no doubt everything wil work in an equally satis factory manner.

CORNS AND BUNIONS REMOVED.
DR. BYRON C. KENNEDY, practical Chiropodist DR. BY RON Philadelphia, would most respectfully inform the citizens of Sau Francisco that he has opened his office at No. 12 Montgomery street, opposite the Lick House, where he is
prepared to remove all escresences, such as Corns, Bunions. Inverted Nails, Enlargid Joints, Swelled Insteps, Frosted Feet, Chilblains, Callosities, and all diseases of the Feet without pain or inconvenience to the patient.
Dr. Kennedy also attends to Ganglion, or Scorbutic Ulcers, and all other diseases of the Skin. He may be consulted at his office, No. 12 Montgomery street. opposite the Lick House, from 9 to 12 A. M... and 2 to 6 P. M. Having devoted six years of study to this important, but too much neglected. branch of human knowledge, and having studied anatomy under the most skiitiol and scientific Professors of
Philadelphia, and having made this branch of surgical sciPhiladelphia, and having made this branch of surgical sci-
ence my specia' ity for nine years, enables me to operate ski1fully and successfully. Iu England, France and Austria the highest prizes are often awarded to practitioners in this brunch of surgical science, and it occupies with others an equally lotty position in the profession.
Voizin is an illustrious example, a shining light, among the philosophical stars of Europe, and Dr. Byron C. Kenuedy has fully equiled him in this country, as a proof of which the Faculty of the University College of Philadelphia, Pa. complimented him with testimonials.
Dr. Kenvedy has bent his earnest attention to the cure of these diseases, in which he has become so great an expert that he is now regarded as the leader in this country, iu this branch of the profession, throughout the United States.
The following letter, which emphatically speaks tor itself, was written by Dr. W. L. Stevens of the Uuiversity College of Philadelphia:

 will rcpay you for your years on study, and that you may find
or your exertio sin the gew and growing city of the Pacific.

## THE EYES! THE EYES!! THE EYES!!!

## DR. E. H. PARDEE,

Oculist and Aurist to the San Francisco Deaf, Dumb und Blind Asylum.
After a protracted blindness of more than five years, Dr PARDFE has made himself thoroughly and scientifically acquainted with all diseases of the Eye, and is now practic ing with a success that cannot be surpassed in the. United States; and as proof of this he substantiates by mayy ca-es
now in California tbat have been cured loy him, after having exhausted the skill of the eminent physicians and oculists o New York city, Boston and Philadelphia.
From an extensive practical knowledge of more than 14 ears, Dr. Pardee asserts, and is aprepared to prove, that there has been more blindness from bad and improper treatment than from disease itself-how can it be otherwise when we take into consideration the effects of the ord hacknied course of local treatment that patients undergo-Caustic to-day and Bluestone to-morrow-more painful than death and always more tedious than the disease. Patients are daily presenting themselves with chronic cases, and on in-
quiring what had beeu formerly done, the almost invariable reply is, "I had my eyes burned with canstic or bluestone;" 'I was bled amd blistered, then cupped two or three times a, week-had a blue pill prescribed for me at night, and salts in the morning-was ordered in a dark room-to keep my eyes tiohtly bandaged-to avoid the open air and excrcise,"
with fifty other inconsistencies, the aggregate of which is with fify other inconsistencies, the aggregate of which is
sure blindness. Patients should be careful and not place their eyes at the mercies of a man who does nothing but burb them daily, not investigating the circumstances of each particular case, but ignorantly and blindly adopting and following theories the most erroneons, and destructive to the experienced Oculist, who thoroughly understands every disease of this tender organ in all its aspects and varieties. Dr. PARDEE has from sixty to one hundred patients under his daily supervision, and, with but very few cases, they have all been treated by other physicians hefore applying to him-and
all to no benefit. Those wio are doubtful are permitted to call at Dr. Pardee's office and confer vith the many patients who convene there between the hours of 9 and 12 in the forenoon: The. Dr. has a large and only assortment of Artificial Eyes on this ccast, inserted, having all the movements of the real eye, and that they lor $\mathbf{k}$ so life-like that no one can tell them, when properly inserted, frcm the real eye. These
eyes are sold reasonable. eyes are sold reasonable.
All the operations performed, such as "Strabismus," or cross-eyes-" Cataracts"-or removal of the Lens by absorption or extraction;-"Plerygium," or fieshy membranes growOFFICE: -Clay street, abore the Plaza-opposite Plaza Hotel-old No. 217, up stairs.

## ESMERALDA CORRESPONDENCE.

## Aurora, Feb. 9th, 1863.

Mr. Fibirner :-In my letter of Jan. 30th, I promised to reep you pnsted in regard to our doings in this district. 1 avo little to communicare in the way of discoveries thi reek, excepting the Hume Lode which was found a few lays since, and is now the theme of conversation. The oro ooks well, but whether it will carry the owners out of the fittle or big end of the horn, time alone can demonstrate.

## the bodie district.

The great excitement of the day is the Bodie District hich is situated about ten miles South-west of Bodie rreek. The new mines are just below the old diggings. A arge number of well defined lodes have been staked off and ecorded in the local district office. The rock is of a coper color and contains a small percentage of copper. Rock aken from the top of a number of the best newly discoverd lodes assays from $\$ 50$, to as bigh as $\$ 400$ per ton. A new own has been surveyed and lots are held at high figures, hile several new houses are in progress of constructionle present fine weather being favorable to the prosperity ad progress of the new City.
tae tunneling interest of this district
as been little noticed, although it is ono of the greatest nportance to the prosperity of the place. These tunnels re mostly heavy undertakingsand penetrate to a great length fod depth into the several hills upon which they are located, nereby prospecting to a great depth all of the veins of bartz that are intersected by the course of the tunnels arough the hills. This kind of miuing appears to be genrally overlooked by speculators, little or no enquiry being lade for it, when in fact it is one of the best and safest lining investments offered to purchasers, Stock-Brokers nd other mining operators have been generally backward in oming forward and taking hold of this kind of stock, for Le reason that they are, as a general thing heavy and exensive enterprises, a ad a long period must elapse before a eturn can be reasonably expected from the capital thus exended. There is more solidity and permanency in the reat majority of the stock of Tunnel Companies than in nany Quartz Lodes which are now being sold at high rates; he local laws of this district are very liberal in their appliation to Tunnel Companies.

## tUNNELS ON SILYER HTLL

On Silver Hill there are now located and in active operaion, four Tunnel Companies. The first location is the Jnion Tunnel, situated near the base of the hill, on Esneralda Gulch-commencing on the Fast side and runaing vestward, passing through several valuable lodes. The work has steadily progressed since its location and it is now in several hundred feet. It is the oldest location on the hill, and $s$ incorporated. One draw back to the stock of this Company is that the line of its location rans parallel with the Quartz Lodes, instead of at right angles, or nearly so, as it
should do. This is the case with all except the St. Louis. Next above is the Rath and Winsdor Tunnel, below Perry's

Mill-the right of way for 500 fret is claimed by this Com pany, with 2000 feet of croppings, and fifteen blind lodes, of 500 feet on each side, making in all 17000 feet of ground, incorporated, November, 1862; capital stock $\$ 100,000$ shares 1000 at $\$ 100$ each ; place of business San Francisco On the North-west side, on Cotton-wood Gulch, is the American which was located last September, by William P. Pool \& Livingston of your city (not James M. Livengston) and incorporated with a capital of $\$ 600,000$, with 1000 share of $\$ 600$ each. The company claims twenty blind lodes with the right of way for 2000 feet, and they have pushed the work forward with great energy. The tunnel is $61 / 2$ feet high and 5 wide, with an ascending grade of one in.
to each rood, and has now nearly two hundred feet of tunto each rood, and has now nearly two hundred feet of tunor more of the best lodes in Silver Hill. When at the distance of 1000 feet, the end of the tunnel will be at least 500 feet below the surface of the ground. The last and at the same time one of the most important tunnel enterprises on this hill, if not in the district is the Lady Gertrude. This tunnel was located, and is owned and worked by James M Livengston, Brewster \& Kinkåde of San Francisco. Their tannel peaetrates the hill at the lowest point and when it reaches the Old Winnemucca, its depth from the sarface of the hill, will not fall short of some 700 feet and in its course will intersect many valuable gold and silver bearing lodes. It is worked by contract, night and day, at the cost of $\$ 10$ per foot- 400 feet are claimed on each side on every blind ode through which the tunnel may pass. The work of the tunnel is superintended by F. K. Becktel, Esq., a pioneer of the place, a practical miner and an honest and straight forward citizen.

## on middee mil

is located the oldest tunnel in the district, as well as one of the cheapest worked and best conducted Companies on this side of the mountains. Middle Hill tunnel commences at the North end of Middle Hill, about 300 feet South of Court House Square, and runs parallel with the general course of the hill, catting through at right angles some six'y or seventy rich and valuable quartz lodes. It has now reached nearly fise hundred foet, and has passed through two most excellent blind lodes, one of which is over ten feet in thickness and prospects well in both gold and silver. The right of way is claimed for 1800 feet, and fifteen blind lodes of 2000 feet each, making a grand total of 30,000 feet of mining ground. The tunnel is six and a-half feet high and five feet wide, with one inch descending grade per rood. It was located in August, 1861, incorporated as a Joint Stock Company, in September, 1862, with a Capital Stock of $\$ 250$, 000 with 1000 shares of $\$ 250$ ench. On the East side of Middle Hill is also located the Montezuma, which claims similar rights and privileges as other Companies. The tunnel is an excellent looking piece of work, with a good car and car-track. It has now reached the distance of 230 feet into the hill. In my next communication I shall notice Aurora, Pennsylvania, Nevada and Discovery tunnels on Last Chance Hill, and Martinez and Lady Weallly on Martinez
Hill. Hill.

## IRON FOR THE PACIFIC.

The rapid'y increasing demand on the Pacific Cosst, for that great staple of commerce-iron, reuters the early establishment of furnaces for the reduction of iron ore at some convenient point on the Coast a matter of quite urgent necessity. Iron ore. of a very fine quality, has been discovered in various parts of California, but, as yet, at a very great distance from steam communication with the sea board, and at points impracticable tor the delivery of coal for smelting. For many years to come, the above conditions, and the high price of labor and transportation, nust preclude the possibility of California becoming a producer of ron, although sle is rapidly beconing a consumer of that article.
This great commercial need, however, might soon be supplied from a neighboring State in Mexico. Recent explorations have brought to the attention of persons skilled in the manufacture of iron, an immense deposit of that ore in the "Cerro de Mercado," in the immediate vicinity of the city of Durango, the capital of the State of that name in Mexico. The ore in question appears to have formed a mountain of iron, similar in character and formation to the fumous iron mountain in Missouri. Mesers Jose Subizar, Alfred A. Green and James Snegan have "denounced" the mine, according to the Mexican Lawis, and thus obtained legal possession of the same. These gentlemen have forwarded to this city several hundred pounds of this ore which may be seen at this office, and which is pronounced by competent judges, as containing fully 80 per cent. of iron. The ore is exceedingly rich and quite malleable, even in its native state. It exists in inexhaustisble quantities at the mine and may be easily taken out and smelted on the ground. Good coal in abundance is found in the immediate vicinity. The mine is situated only half a league from Durango, between which and Mazatlan is a good road, which in time mustundoubtedly give place to a railroad.
The gentlemen above named are anxious to organize a Company for the purpose of erecting furnaces and machinery for smelting the ore and manufacturing the iron upon the spot.
Certain citizens of Durango are willing to take a large amount of stock in the Enterprise, provided the right kind of a Company can be organized, and placed under the management of citizens of the United States, and directed by persons of experience and energy, who are thoronghly acquainted with the business. There is quite $\pi$ growing demand for iron in the interior of Mexico, and the facilities forits transportation to tide water are such as must give it an advantage in this market, over that produced in any other part of the world. The attevtion of capitalists and ir n mien is particularly called to the Entertrise.

Scoldina.-It is better a woman should scold than do worse. Better for you to endure the present ill than fly to others you know not of. No one relishes the noise of scolising. But, then, scolding may have its advantages. No one likes the noise of a boller blowing off steam ; but it saves the bailer from bursting, we she uld bo content to endure it.

## BODIE MINING DISTRICT.

This new mining district which is incidentally referred to by our Esmeralda correspondent to-day, and which has come into especial notice within two or three weeks past, is located ahout ten miles Suath of Aurora City, Esmeralda. The locality was first discovered by some Frenchmen, as early, we believe, as the summer of 1858 . It was worked as placer diggings until the summer of 1860, when some of the disappointed adventurers to Washoe turned their steps Southward, and prospected along the base of the Eastern Slope until they reached Esmeralda, where they made a halt. From this place a small party went on still farther West, until they encountered the Frenchmen, above alluded to, with their rockers, washing the golden sands from the limited placers of what were thereafter known as the "Bodie Diggings." The new propreitors were looking for "indicatious," and were soon elated with the discovery of gold and silver bearing rock, which led at once to considerable prospecting. Barely work enough, however, was done to develop the presence of promising ore, but not enough to warrant the erection of machinery at that early period, and under the almost total lack of roads.

Matters were thus allowed to rest until some time last fall, when a Company, made up chiefly of San Francisco and Sacramento Capitalists, recommenced operations there, and with such flattering indications, that a consolidation of some eleven companies was made into nne incorporated body under the name and style of the "Bodie Bluff Consolidation end Mining Company," with Governor Stanford as President, and F. K. Becktel, Esq., as Secretary. Their operations thus far have met with the most encouraging results.
About the middle of last month, the town of Aurora was all excitement with golden stories from the Bodie Mines, and "everybody" went out to see the rich strike that had been made, and came back fully satisfied that there was a "good thing" there for "somebody."
Favored by the unusual mildness of the winter the Company has been able to push on its operations with an unusual degree of vigor. About two weeks since, Mr. T. J. Hubbard, Superintendent of the Consolidation Co., according to the Aurora Star of the 31st ult, came into town with some ten pounds of very rich ore from the Company's "New Mexico" Shaft. This vein has been opened to a depth of about eighty feet, and exhibits a character of most unquestioned richness. The vein is six feet wide. T'unnels are being run into the Isadora, and others of the Company's claims which are most promising in their "indications," The Company own eleven distinct leads, the most of which are known to be very rich.

There are two other Consolidation Companies in this district, in active operation. Mills will doubtless soon be put in operation there. The nearest mills, at present in operation, are nearly six miles distant from Bodie, on the road to Aurora. Important results may ere long be expected from this new locality.

Miners Wanting Water.-Much complaint is now being wade in nearly every section of the mines, at the lack of water for mining purposes. The rivers are unusually low, and many small creeks and gulches which usually furnish an abundance of water for their respective localities, during the winter months, are now almost dry. The searcity of water the present siason affords a striking contrast to the floods that poured over the country one year ago. Late adnces from Lower California say that the "early and latter rains" have not yet (up to Jan. 7th,) made their appearance there, while the natives insist that the "rainy season" has fully passed.

Mining in New Zealand.-Several Quartz Mills have recently been put np sear Aukland, in New Zealand. The mines are said to be very rich and the leads very largely developed. At the latest dates from there, it was expected that the problem would be solved in a few days.

The house of a Mr. Longley, in Hopkinton, Mass., took fire lately in the absence of most of the male inhabitants. The ladies, therefore, got out the engine, dragged it to the fire, maned the brakes, and the fiery element soon went out n a sizzle.

## SILVER IN CARIBOO.

The British Colonist, published at Victoria, of a late date claims that rich silver and gold bearing rock has recently been discovered in Cariboo. The mines have lately been visited and examined by a scientific gentleman, who fully confirms the reports. These silver veins are found on the Sougues Creek, and about fifteen miles North of Quesielle village. 'I'wo companies have been organized, and have taken up claims. A quantity of the rock has been taken to Victoria, and it assayed from $\$ 250$ to $\$ 300$ per ton in silver and $\$ 50$ in gold, and 800 pounds of galena. The rock was from a deptli of noly five or six feet. It is said that the ore very much resembles that of the Comstock lead in Virginia City. It is expected that it will rapidly increase in value as it descends. The above may all be genuine, and we sincerely hope it is-but we greatly fear it will prove only the initiatory steps in the programme for another Cariboo excitement.

## WASHOE MINING CASES.

The following Mining Cases now pending before the First District Court, in Nevada Territory are set for trial as fol-

Feb. 26-Calilornia Co. vs. Charles Anderson et als.
Mar. 10-Robert R. Moss vs. Gould \& Curry Gold and Silver Mining Company.
Feb. 27-Frank Perkins vs. Sierra Nevada Mining Co.
Feb. 20-Burning Moscow Company vs. Madison Mining Company.
Mar. 12-Chollar Silver Mining Company vs. D.S. Turner.

Mar. 6-La Crosse Mining Company vs. Burning Moscow Mining Company.

A Mining Transaction.-A miner from the mountains stepped into the salesroom of one of our most wealthy merchants, about four weeks since, stated that he was "flat broke," and asked for $\$ 150$, offering to make over to the aforesaid merchant, a mining claim for the money. The merchant, knew nothing of the man or his claim, but gave him the money and took his bill of sale. He thought no more of the transaction until a few days since, when a stranger called at his place of business and asked him if ho was the owner of such a claim. Receiving an affirmative answer, the stranger offered him $\$ 4,000$ for the same. The merchant hesitated a moment when the stranger added another thousand to his offer. The merchant immediately closed with his visitor and pocketed the cash without any further remarks. The merchant is still ignorant as to whether he sold a folly or a fortune.

Large Treasure Shipment.-The treasure shipment per steamer Constitution, on the 11th, was as follows :-

Total shipment. . . . . ................. \$2,190,572 29
One million of the above was shipped on Governmentac count.
Esmeralida Post Office.-Much confusion exists with regard to the proper direction of letters for Esmeralda. They should be addressed thus : Mr. _ Esmeralda, Mono Co., Cal.
There is only one Post Office in the County, and that is located in the town of Aurora. When the petition for an Office was sent to Washington, "Aurora" was named as the designation of the Office; but as that name is so common, the Department thought proper to adopt the name of "Esmeralda." It would be well, we think, for the citizens of that enterprising mining camp to change the name of the town to correspond with the Post Office. It would be more distinctive and less linble to create confusion.

The Mines in Chien.--The silver mines of Atacama exported 800,000 ounces of silver in bars, $8,000,000$ pnunds of silver ore, $8,000,000$ pounds of copper in bars, and 70,000 ,000 pounds of copper during the first eight months of 1862.

At the Annaal Meeting of the Stockholders of the Melones and Stanislaus Gcld, Silver and Copper Mining Co. the following persons were elected os Trustees for the ensuing year: : L. Caralis, C. C. Grellet, B. E. Auger, A. C. Gay and Gabriel K. Sternot ; and at a Meeting of Trustees held the same day the following Officers were elected: E. Cazalis', President; G. Dusiol, 'Treassurer, and L. Franconi; Secretairy. Office at North-easit corner of Montgomery and Jackson Srteets, Jroom No. 16.

The Hope, Gold and Silver Mining Company, situated in Prince Royal District, Humboldt County, Nevada' 'Territory, is now fully organized. The Officers and Trustees are Sid ney Johnson, Esq., President ; Leon Mejasson, Treasurer ; L. Eirunconi, Secretary, and Messrs. B. D. Aüger, Michel Sehetard and A. Pavillier, Trustees. Office, North-east corner of Montgomery and Jackson, Sts., in Room 16.

Marriage of M. Guizor.-The somewhat romantic circumstance that led to the marriage of M . Guizot is quite generally known. We give it, however, for any one who is. not familiar with it:-
Belonging to a family of distinction, but which had been uined by the revolution, Mlie. Pauline, de Menlan had found her resources in an education as solid as it was varied, and in order to support her family she had entered the difficult and absorbing career of journalism. She was the editor of the Le Publiciste when a severe illness caused by ovep work obliged her to interrupt occupations so necessary to the welfare of those she loved. She found herself in a critical position ; she was despairing, when one day she received an anonymous letter in which the writer begs her to be as ease, and ofters to perform her task during the period of her ink
ness. This letter was accompanied by an elegantly written article, the ideas and style of which were, by a refinement and delicacy exactly modtled upon the manner of Mlle. de Meulan, who accepted the article, signed it, and regularly Ueeply touched by this event, Mlle de Meulan did not fail to relate her adventures in the drawing room of M. Saud, exhausting herself in enquiries, and not thinking of a pale and serious young man whom she scarcely knew, and who gravely listened as she formed all sorts of conjectures Earnestly entreated, through the columus of the journal, to make himself known the generous incognito finally decide to go in person and receive the thanks he so well merited, It was the same young man to whom we have just alluded, and five years after Mille de Meulan was Madame Guizot.

## Remembered and Mourned.-A sad and truthful pictare

 is the following :-For every man who falls in battle some one mourns. Fou every man who dies in hospital wards, and of whom m note is made, some one mourns. For the humblest soldien shot on picket, and of whose hamble exit from the stage of life little is thought, some one mourns. Nor this alone For every soldier disabled; for every one who loses an arry or a leg, or who is wounded or languishes in protracted suf fering ; for every one who has "only camp fever," some hearn bleeds, some tears are shed. In far-off hamble householde perhaps, sleepless nights and anxious days are passed which the world never knows; and every wounded and crip pled soldier who roturns to his family and friends, bring lasting pang with him. Oh 1 how the mothers feel this wa If ever God is sad in Heaven, it seems to me it must when he looks upon the hearts of mothers. We who young think little of it; neither, I think, do the father brothers know much of it ; bat it is the poor mothers wives of the aoldiers. God help them.

A Rather Tough Story.-A learned dissertation held, the other evening, upon the subject of "Bed-bugs ani their remarkable tenacity of life." One asserted that th could be boiled and then come to lite again. Others s that they had soaked them for hours in turpentine withou any fatal consequences. Old Blood, who had been listenid as an outsider, here gave in his experience in corroboratio of the facts. Says he, "Some six years ago, I took a bei bug to an iron foundry, and dropping it into a ladle wher the melted iron was, had it rua into a skillet. Well, old woman used that skillet pretty constantly, and here other day it broke all to smash, and what do you think, tlemen, that ere insect just walked out of his hole, where hes been layin' like a frog in a rock, and made tracks for his 0 roost up stairs! "But," added he, by way of parentbesi "by George, gentlemen, he looked mighty pale."

Ir is said that in England three hundred families contre the Government, a few thousand landlords own all tl soil-five men ewn one fourth of Scotland, fand five lious of adult men have no voice in the Government.

## MINING AND SCIENTIFIC PRESS.

## SAN FRANCISCO MINING NOTICES.

ASSESAMENTS LETIFD.
Assersmenta upon Miniug situck have been levied as fol-
C'uledunis $G$. \& S. M. Co. levied an assessment, Feb. 1 f ju conts per share, payable imnediately. Sulo of delinent stuck will be made Mareh Th.
Muss 1s. \& S. K. Co.-Au assessment of 50 cents per hurd was levicil Jant, 27, payable at +2n, Montgumery st. It tho superintendent at the mine.
White C'loul (G. \& A. M. Co. levied an assessment of ic conls per shire, $\mathrm{O}_{\text {an }} 27$, payable to the Secretary, at 24. Montgomery it.

Wurren ( $\mathrm{i}, \& 8$. Mining ( B - - An assessment of \%i) ets share was levied Jan. 26, payable to the supt, at Vingin4 City, or to the sec., 426, Muntgonery sit.
Warren (t. \& S. M. Uo.-An ilssessment of 50 cents er share wiad levied $\sqrt[J]{ }$ en. 27, payable to the sec. in this ci$y$ or to the supt. at the mine.
Eil Duraib G. \& S. M. Co.-An assessment of One Dul ir per share was lovied Jan. 23, payable to the sec. or to Le Sixpt.
Gaudaloupe S. M. Co.-An assessment of \$30 per share as leviend. payable on or befure March list.
El Tesora Miuing Cu.-An assessment of $\$ 11 / 2$ was levdan. 27, payable at uffice on or befura Feb. 27.
Pular Star G. \& S. M. Co. levied an assessment f 50) ceuts per share, February 4th, payable on i before the 4th of March, at the Uffice in this city or

Dios Padre G. \& S. M. Co. levied an assessment of 3 dollars per share, Jin. 31, payable in 30 days, also an assessmeut of 2 dollars per share, payable in 60 days, at office 502 Montgomery street.
Beckwith G. \& S. Mining Co.-An assessment of 25 couts pur share was levied Jan. 24, payable immediately.
Sonoru Mining Co.-An assessment of 25 cents per share was levied dan 23 , payable imediately.

Overman Mining Co.-25 cents jer foot, Jad. 29, payable within ten days.
('hs. Caney Mining Co. -50 cents per share, Jan. 21 , payable on or before lieh. 20th.
Auratic.-Fifty cents per share, parable at No. 4 Armory Mall, San Francisco, or to the Saperintendent at the Mine.

Hattic G. \& S. M. Co.-Thirty cents per share, levied Jan. 31, payable at Office in San liruncisco, or at the Mine.

Tale \& Norcsoss-Assessment of Ten Dollars per Share, levied Jan. 3 - payable at the Office in this city, or to Juhn Skae, at the Mines on or before Fel). 25.

Sierra S. M. Co. An Assessment of 821 was levied Jan. 22 - payable immediately, at Offee 570 Mission St.

Mount Iavid:on Co.-Au Assessment of 50 cents per Share was leviel. Jan. 23. payable on or before Mareh Ist, ut Utice $k 7$ Montgomery Block.

Mina Pricta S. M. Co.- An Assessment of Five Dollars per sharo was levied, Jan. 31, payable on or bi fore March 5 th-at Office, cor. Moutgomery \& Jackson Sts.
Recorder Mining Co.-An Assessment of One Iollar per fout was levied Jin. 19, payable half on or before Feb. 18, and balance on or before March 20.

## Assessment sales of mining stock.

North Poto-i Mining Co.-Sales deliquent stock will be made March 17.
Peytona G. \& S. Mining Co.-Sales of delinquent stock will be made Ilarch 1st.

Sales of Stock for non-payment of assessments are advertised to bo sold as follows :-

Cole Silver Mining Co_-Sales by Jerome Rice \& Co. 327, Montgomery St., San Francisco, on the 25th of February.
Combination G. \& S. Mining Co.-Sale by E. S. Spear
\& Co., at 133 California St., on the 10 th day of March next
Normon S. M. Co.-Sale by John Middeton \& Son, 40 Montgomery Block, on Feb. 16.
Burning Moscorr.-Shares of this Company, in arrears for assessments will be sold at auction, Fel. 9 .

## company meetings.

The Lewis G. \& S. Mining Co.-Annual Mecting will be held at 622 Merchant St., Feb. 12, for election of offcers.

Ida G. \& S. Mining Co.-A Meeting of Stockholders will be held at 522 Mantgomery St., Sais Francisco, February 17 th.

North Winnemucca $\mathcal{A}$. \& S. M. Co.- $\boldsymbol{A}$ meeting of the Trustees will be held at the Company's office, in this city, on Friday, Feb. 20, for the election of Officers, etc.

Baltimore America Consoliduted.-Auassessment of 50 nts per share was levied, Jun. 5 .
Siwage.-All assussment of $\$ 35$ cents pershare was leviod. Jan. 7.
Hawley.-An assessment of 25 cts . per slure was levied an. 5, payable in 30 days.
Cole S. M. Cin.-An assessment of One Dollar per share pas levied, Jan. 10, payable, Feb. 1.
United Sitates M. Co.-An assessment of six and two hirds cts. per share was levied Jan. 10, 1863 , payable to the superintemdent at the mive, or to the Secretary, Rooms if and 8 , Guvermment IIonse, Gan Francisco.
Sierra Nevada S. M. Co. levied an assessment of $\$ 15$ per share, Jan. 15 -payable Feb. 18.
Lady Bryan. - An assessment of 70 ets. was levied, Jan. 13. payable on or before Feb. 16.
lda G. \& S. C'J. (Russ District)-An assessment of $\$ 1$ was levied, Jan. 14.
Henry Martin G. \& S. M. Co--"Thomas Wallace, Trustee." gives nutice that whereas certain parties illegally claim ing to be Trustees of this Company, have changed the name of the Corporation to the North Star G. \& S. M. Co., and illegally elected officers for the same, the public are cautioned against such acts, etc.
Red. Wifte and Blue G. \& S. M. Co. levied an assess ment uf 25 c nits per share, payahle un or before Feb. 1st office cor. Pine and Montgomery Sts.
Live Oak Copper Co.-The Annual Meeting of Stockholders for election of Trustees, will be held at Office, in Montgomery Block, Feb. 2, 1863.
Coso Silver Mining Co.-The Office of this Company has been removed from the Stevenson House to Nos. 11 and 13 Court Block, No. 636 Clay street between Montgomery and Kearny. Entrance on both Clay and Merchant streets.
Mina Prieta S. M. Co.-An assessment of $\$ 10$ per share was levied. Dec. 26, 1862-payable at office, cor. Montgomery and Jackson Sts., on or before Jan. 26, 1863.
Franco-Americano S. M. Co.-The following persons were clected officers at the meeting of trnstees, Dec. 26thChas. F. Gaian, President and A. S. Gould, Secretary.
The office of this Company has been removed to No 528, Clay street, Room No. 2.
Central Silver Mining Co.-The Annual Meeting for the election of 'I'rustees will be held Jan. 13, at Office, No. 712 Montgomery street.
Lady Bryan G. \& S. M. Co.-Shares of delinquent stockholders will be sold at auction for asseasments, at No. 400, Montgomery steet, on Jøn. 27.

Desert Mining Co.-Shares of Jelinquent stockholders will be sold ai anction, for assessmonts, at No. 400, Mont gomery street, Jau. 27.

Keystnne Copper Mining Co, advertise for preposals to purchase or treat 3d quality copper ore. Proposals received till Jan. 15th.
Hale \& Norcross S. M. Co. have levicd an assessment of $\$ 5$ per share payable ou or befure Jan. 26 th .
Martin White. An assessment of 20 cts. a share mas levied, Jan. 2.
Oriental G. \& S. M. Co.-An assessment of 50 cts , per share was levied. Jan. 14. payable at Office, cor. Sutton Avenue and C St., Virginia City.

Normon S. M. Co--Middleton \& Sons, No. 40, Montgomery Block, will sell delinquent stock of this Company, February 16 th.
Baltic Mining Co.-Notice is given of an adjourned sale of shares in this Company, to take place on the ground, Jan. 31st.
Caution.-D. M. Tyrell warns persons against purchasing a certain 10 feet of ground in the Wellington Co., standing in the name of J. B. Magee-also 20 feet, standing in name of W. Williams. (See Territorial Enterprise.)

Ashland Co.-L. A. Gould, in the name of the Moss Co. notifies the A shlaud Co. that their westerly drift has cut the Lamb ledge, in the Moss Co.'s ground, from which the Ashland Co. is forbidden to extract any valuable metals.

Eldorado G. \& S. M. Co,-An assessment of one dollar er share was levied, Ded. 31, 1862, payable, Jan. 22, 1863, to the Secreary, at corner of Montgomery and California streets, or to the Superintendent at Virginia City.
Toxas Co.-Tennessee Ledge.-An assessment of 25 cts
per foot was levied, Dec. 22, payable on or befure Jan. 21 863.

The North American Co., Gold Hill, will sell at auction Jan. 31, stock of shareholders delinqneut in paymeat of sesaments.
Martin Wieter Mininga Company. - An assessment of ten ocnts per foot has herm levied, payable to the Secretary, at

The Siweenky (Con, Goud Hill, give notice that Baltic Compnny haw wrongfuly clained and worked their ground since July, 1 ar: 0.
The: 'manky Rock Con, bine next west of the Tirginin Co. clams have notified the Hazel Green, Tingley and The ach A Paxton ('ompanys that they are treespassing upon tho Chimney Rock Cu's gromed.

## ESMERALDA MINING NOTICES.

The Zenobu Lome Compani, give notice that they clam $\Omega$ superior title to the Johnson Co.. cluming the same grovind, so far as sais localities couflict. This ground is a jortion of that now held by the Cumprany known as the Wride West Company. The notice is sigued by A. Waddell, J. C. Dorscy. S. P. Dorsty and Jamen Elder,

Orfe Tests.-Several inquiries have been made to us of the different chemical tests that will discover traces of silver amd copper in the rock. If our friends who are convirsant with this matter will forward inlormation respecting such chemical tests to us. we will be happy to give them publicity. [Amador Ledger.
Persons interested in the above will find the desired information, and much more in the same connection, all valuable to copper and silver prospectors, in late numbers of this paper. A remittance of six months or a years subscription to the Mining and Scientific Press, will afford them all the valuable information obtainable from books in relation to prospecting for either silver or copper, and assaying and testing ores of the same. The dissemination of that class of information is the speciality to which this paper 18 devoted, and no mineral prospector in the silver and copper regions of California can invest $\$ 4$ to better advantage than hy sending the same to this office and becoming a subscriber and reader of the Press. Wo shall be extremely happy to receive the names of all who may favor us with cash patronage. We also pledge ourselves at the expiration of the year to refund to any party double the amount of his subscription, who may honestly think he has not got the worth of his money in valuable information from our columns.

## MINING AND SCIENTIFIO PRESS.

THE ONLY MINING, MECHANICL AND SCLENTHFIC paper on this continent.
THIRD TEAR: VOLOME VI,-NEW SERIES I
A new volume of this oxtensively circulated paper commencod Sept. 11, 1862. It is iutended that every yumber sthall be repleto with informution
concorning Niume, scientific, Mechnnieal and Iudustrial pursuits, together with several orignal engraviogs, of uew inventions, etc., preparud expressly for its columns.
The papyer is flovoted to the above purposen, together with the interesta of science, Arts, Agriculture amm Commerce, ana any gencral intormation that may be of interest to the reader : and it is the intantion of the proprio-
tor tospare ounajus or expense in making it equal in iuterest and valuable tor to spare du paius or expense in maki
information to any paper yet published.

## The Mining Interest!

Will find it of great valuc, as it will contain all the news appertaining to Mining, the mives and sales of Mining Stucks, vew inventions of Machinery
allanted to tuai purpuso, and of uvorythug gencrally that may be ot service to the Miner.

## The Inventor !

Will find it an excellent medum for the purpose of bringing his invention into notice, of ascortaining tho progress of invention in this and other
countries, and also of receiving any information that may be uecessary in ohtaining his patent the prantietor baviug had great experience as a Patent Aerut, together witb facslities at Fashington that enable him to ob aia Patents with cispmeli.

## The Mechanic and Manufocturer !

Will be greatly benefitted by its perusal, as each number will contan serlargo amount of reatling matter appertainmy thereto. Wo are constavtly receiving the hest scientife journals fiom all quarters, from which we
shall continuo to extract whatover may be of benefit or intercest to our slialt coutid

## To Chemists, Architects, Millwrights and Farmers !

 This journal will be invaluable. All new discoveries in Chemistry will be Fiven, ind a largo amount of our columns. The Farmers and llanters will not be neglected, engrarings will be given of agricultural implements, and the farming interesi generally will be amplly discussed.Terms.

To mall subscribers:-Four Dolinrs per annum. Club Rates.
Five Copies for Six Months, $\$ 5$
Ten Eophers for Six Months, git.
Ten Copies For Twelvo Mniths, $\$ 30$.
Fitten Conies for Twelve Mouths, $\$ 44$,
Tweuty Conics for Twolve Months, 556 .
For all clubs of Twenty and over, the yearly subscrintion is only $\$ 280$
Namus can be srut in at differcnt times and litom diffrent Postoficos

An Thtrrest in one of the most fomrishmg and best paying Newspr per Offices in the mountains is ontored fur sale on easy ierms. A rare op portunity is herely preacnted to any priuter desimus of eatabtinhing him. self in a gond buiness in the of the healthest, most thriving atad delight Self in a gond buiness in one of the heathest, most thriving and delight
fut moutain tuwns is the state. For further infurmation evquire at this offico.

## MINING INCORPORATIONS,

Notwithstandiug the attempts at editorial pleasantry that are so frequently indulged in by our cuntemporaries, at the lergtheniug list of miniug Companies, and the cumulative exhibits, of the many millions of capital which they represent, "ot paper," each passing month briugs additional exidence that this wealth is far from imaginary. The constant1y inereasing values of the figures which appear in our weekly stock reports, appended to the learing mines on the Eastern Slope, are subboru facts, which must soon make pluin to the most unbelieving that the foot ngs of the aggregate "capital," placed as a value upon the nuiues now in progress of development, are not much too high. Imagination can scarcely form any adequate cenception of the mineral wealth, which is soon to be developed on the Eastern Slope. and throughout the entire length and breadth of the "Great Basin," whose Western and Eastera rims are formed by the rocky slopes of the Sierra Nevada and Rocky Mountains.
Several of these earliest formed Compauies, which, in the estimation of the great mass of people at that time, fixed their capital stock at an alnost fabuluus figure, lave already reached the immediate vicimly of their incorporate value. and their stock will no doubt, ere long, be quoted at a handsome percentage "above par." Indeed, one of them has already exceeded its par value and is quoted to day at more than 60 per cent. adrance.

Numerous others, second and third class mines, are making such favorable developments, at the present time, as give good earnest of an early approximation of their stock to par value.

A ferr jears since scarcely a merclant in San Francisco could be induced to invest a dollar in any mining enterprise. To do so was to lose caste, and endanger one,s credit "on change." Ereu our foundrymen, could not be induced to invest a dullar, in a business to which they were then, as now, indebted for almost their entire business. Now things are entirely chauged, and one can scarcely find a ma.r in Sau Francisco who does not own "feet" in some mining claim
What matter is it if a large portion of these projected companies should fail? All, or even a majority caunot hope to succeed. A sufficient number, howerer, will prove so remoneratire as to return a handsome aggregate pe:centage on all the money invested. Hitherto the chief burden and losses attendant upon openiug up the mines of Catiforuia, hare fal'en upou the mining conmunity almost exclusively, while the commercial and agricultural interests have been greatly profited at no risk. It is one of the conditions of mining, everywhere, that many individual losses must ocenr, which, however, are always made good in the general aggregate of pr.fits; and it is creditable to the mercantile interest of this city that it has now taken huld of the matter of dereloping the miues of the State anui is freely pouring out its carpital for that purpose. The aggreyate of these invest ments cannut fatl to le highly remunerat.ve, and will reward the loosers even, in the increased business which qhey will create and concentrate in Sau Franciseo. Thris
city owes its very existence to the mines, and it betrays a feeling of selfishness in any man of means, to refuse to do his part in developing the interest upon which its prosperity depends. Every new Mining Company, whose arganization is announced, is evidence that a new mine has been die covered, and that somebody intends to speud a little money for its development. Every such item is a matter of encouragement, and indicative that the great interest of the State is progressing. We trust the day is tar distsint when we shall fail to find in each morning's paper the annoucement that some new mining organizai ion has been effected during the previous day.

## minivg education.

In our last issue we referred to some of the disadvantages under which the California miners, as a class, labored by reason of the lack of a proper Mining Education. We also adverted to the fact that the popular antipathy against the application , f science to mining, which was so prevalent anong California miners, six or eight years since, has lately been pretty much laid aside. It is now very generaily conceded that an empirical knuwledse of mining is uot the way to succeed in that difficult and uncertain branch of industry. The occurrences connected with the discovery and development of our silver and copper mines have produced sach a clange in public sentiment that, at the present day, it is rare to find a man who will openly avow, even if he secretiy entertains, a belief in a decessary antagonism between theory and practice. Prestice and science have now joined lands in the mines, and the time has passed when the former will venture "to go it blind" in the vaiu confidence of shallow enapicicism. unaided by science.
'The attainment of a passable mining education, when proper facilties and instructors are at hand, is not a work of so much time and study as many suppose. The difficulties aud mysteries involved in becoming an expert in planning and working a miue, and in acquining a practical knowledge of their geological and mineralogical characteristics, are no greater than are to be met with in many other subjects in the usual programme of practical and theoretic education. Experience is the foundation of success in all human undertukings; bat the only value of experience is the facility which it aflurds us to deduce from previous results, a knowledge by which to overcome new or greater difficulties. This is identical with the inductive process of the man of science. But he that confines himself to his own limited experience, shuts his eyes agaiost the lights of science; and, in despisiug the experieuce of others, he will soon find himself burried in the darkness of empiricism, while those who have entrusted him with their business will sarely behold their undertaliugs enveloped in a labarinth of dificulties, which must sooner or later result in common and promiscuons ruin.
A large mine is a complicated machine, aud we might with quite as much propriety place a ploughman, with no mechanical experience, whatever, in charge of a double cyl. ender printivg press, as to place a man, whose experience in min ng is confiued to what he has dume himself, in charge of a mining operation of any magnitude. The art of mining involves a, general knowledge of mechanics, surveying, mineralogy and geology. To understand working a mine-boring, siaking, pumping, winding, stopeing, hauling and ventilation a tolerably correct knowledge of every leading principle in mechanics is needed. Without such knowledge the miner will find it mpossible to decide upon the most economical means and arrangements for transport either in the mine or on the surflace, the kind and capacity of engines needed, or the character and class of machiaery best caleulated to perlorm the work before him. Layiug out the work propererly, each part with reference to another, requires a knowlelge of surveying. To ascertuin the proper place to sink shafts, involving calculations of the dip and strike of strata, prubability of water, faults, \&c., implies a knowledge of geology: while loy the aid of miveralugy only, can he determine the nature and vaine of the minerals upon which he is working, or which may chance to come in his way. On a correet conclusion with regard to each and all these points depends the sucuess of the undertaking. The emplogment of experienced mes with liberal salaries, to superiutelud works
of this description may, safely be predicted as uniformly resuiting iu larger dividends to stockholders, and increased safety to mile aud workmen. Experience, coupled wilh a
proper application of science, is the only foundation of fitness for the position of Mining Superintendent. The lack of these requisites has cost English adventurers millions of pounds sterling-sometimes in the faulty opening of a miue, at others in the lack of mineralngical knowledge for determining the value and character of the mineral when found. We gave several instances of the latter in our last issue, we might multiply instances of the former adinfinitum.
It is to the lack of this latter information that we must at tribute the delay in the development of the silver and cop, per mines of the State, a full decade beyond the time when their existence should have been known as the result of actual explorations.
There is but one way to remedy the evils here pussed in review and provide our State with a competent corps of mining cagineers and superintendents- $A$ Scloool of Mines must be established under the patronage and partial control of the State. An institution of this kind is absolutely. necessary to a proper development of our resources. Wo need it as a collector and conservator of mining knowledge past and progressive. We need it as an institution for the general diflusion of information ia this branch of industrial science. We need it as a place where the working miner, the proprietor and the engiueer may be drilled and schooled in the art of mining, in all its bearings. Such schools have long been in existeuce in nearly every country in Europe, where they are fostered with the greatest care by the differ eut govergments. We shall endanger our reputation ad a progressive people if we much longer delay a movement in this direction. The losses of property and misdirected out lay of capital already seored up, (to say nothing of the sad loss of life,) and laid at the door of inexperience, would have literally endowed half a score of such schools.
Our State Geologist, in his address brfore the Legislature two years ago, advised the early establishment of such a school. We have now a Legislative Committee on Mining. Is there any more important matter which can come before them than that which we are now discussing? Huve they ever thouglt seriously upon it? If so, or if not, heretofure, why would it not be well, at the present time, to prepare the general ontlines of a plan for such an institution, and let it go before the people, with a legislative endorsement, for future consideration.
Legislators are quite ton prone to think that when they have enacted laws for the cr ation and collection of revenue, for the collection of debts and the prinishment of crime; and, perchance, performed the lereulean task of electing a United States Senator, they have fully discharged their legislative duties. They forget that there are other equally, if not more important duties to perform, in proriding the means for properly educating the adult industrial class of society. This is universally done in Europe, at least to an extent sufficient to proride competent directors for all the great industrial interests of the laud. We have neither time nor space to say more under this head than what will be merely surgestive ; but we hold that it is quite time our Legislators should take this matter uoder consideration, and initiate some steps toward an ultimate accourplishment of the end in view. The present "let alone" pulicy must inevitably continue to result in serious losses, both to individu, als and the State, and we slall be fortunate indeed. if our chief industry is not thereby soon completely burried in the darkness of that empiricism in which it is already so sadly floundering.

## COPPER MINING.

A celebrated geologist says:-"Give me a good Copper Mine, and I will not ask for silver or gold." That geo.ugist was a sensible man and knew when he had a "good thing." What proportion of the numerous copper nines, that are now being opened, in varions portions of the State, will prove "good" or remunerative, it it impossible, at the present time to furetell ; but euough has already been developed to prove that the copper mining interest must soon become of great importance to the state. There appears to be a belt of country, sone eight or ten miles wide, rich in ores of copper, and extendiug along the middle portion of the foothills from the extreme Southern portion of the San Jiaquin valley, as far North as Feather River. Auother, and apparently extensive field, has been discorered, embracing a large portion of Del Norte and Klamath counties and extending thence iuto Oregon. In our issue of January 12th,

#### Abstract

- gave some statistics showing the profits of mining for coppuer in veins which assay from 15 to 20 per cent., proving conclusively that such veins must soon become very valua13lo. Cupper ure that will assay 20 per cent. is worth about \$120 per ton in Nuw York. An advance of at least \$j0 per win can be obtaned on all such ore in this city. A well defined copper mine, that will assay 22 per cent, and so locited that its ures can bo laid down in San Francisco, for $\$ 15$ per ton, is really worth as much as the richest gold and silver mine in Wishoe-Ciould \& C'urry and Ophir not excented, provided the mine is capable of turning out the same anount of rock as the Wishoe mines.

 STOCT REMARKS.The Jinlng Market, for tho week, has manifested a fair degree of activity notwithataudhg the unfavorable condition of the weather mueh of the
time. The diapositma to operate in second and third chass stochs, appears time. The diapositimn to operate in second and third class stochs, appears among nperatora in thas eity. Our Slock Report from luat district will be found full and reliable, avd preseuts a very cacoaraging indication of the progress and value of the mues iu that loeality.
Ophir is without any materfal change. With sumo little fluctuations in the interm, the Elock board clused the two last weeks with the same fig-
ares- $\$ 8,600$. The recent influx of water to that mine, has arus- $\$ 3,600$. The recunt influx of hater to that mine, has been overcomo.
It proceded, as we intimated it possibly did, from a uew veiu of ore, which had been struck in the drift being driven Wentward. The ore is pronounced rich. If so, and the vein should prove, as is thought it may, to be the "Tirginia," the late putchase of that Compauy's miue must prove of great adrantage to the Ophir Company. Gould \& Curyy has been but littlo tations. \$100 per foot is offered for the next dividend. It is rumored that
the this Company has withdrawn its ores from all outside mills, for what pur pose is not knowu outside of the Directors.
Chaflar has recencel a material check in its upward tendency, and has beeu subjected to great fluctuations during the week. Sales have been
effechin as low as $\$ 550$ and from that up to $\$ 550$ ling been puid effectid as low as $\$ 350$ and from that up to $\$ 550$ lans beon paid.
Potosi, ut the close of the week, malied from its low
Potosi, at tho close of the week, ralied from its low rates of the previous ten days aud now stauds firm at \$20 advance.
The Cbarles Caney is stilladvaucug, although wavering a little at the
close ot the weck, notwithtanding the intelligence of the seltlement its stit with the Danry Cor, by accepting 100 leet of the 180 feet in dispute. This piece of gromen was baown to be valuhhe, and the loss of 80 feet of griod ground nect cause no uncasiness to stockiolders, especially as operaLinas arn in progless which will, in all probability, sonu develop a largu ex
 comby hought to be out of rench, except by extraordinary expenso. The
muscht suptatentent of the mus is a man of eocrgy and one thoroughly musent supte mtendeht of the
acquainto with his business.

Wisc Weat shates hase experienced further fuctuations. They opened at $\$ 350$, fell to 320 , but rallied at the close of the week to $\$ 335$.

## NEVADA COUNTY STOCK REPORT.

[Complad frgas tee nevada Demociat.]
In consequence of the snow and late stormy weather, but little has been done the past week in the ray of prospecting. When the snow has passed away, operations that have been temporarily suapended wilt be again re-
sumed. There appears to be no abatement of the copper excitement. and sumed. There appears to be no abstemout of the copper excitement, and
new leads are coustuntly being discovered. An extonsive copper lead ruuaing through Perrin's Ranch, on Woll Creek, has lately been brought into notice. The lead bas been taken up for a distance of $14, \mathbf{0} 00$ fect, and three rifferent companies are now engaged in prospectiog it. The leals are usually praspected by organiziug a cooprany of from twenty to sixty shares, and levying an assessment of from ons to two dollars on each. Whare the leads are so situated that they can bo opened by sinking shaftse or running tunacls, thus avoiding the expense of a steam pump, tho cost $0^{-}$ prospecting does not exccod one or two handrel dollars.
ally be ascertained whether the ore wilf pay for workiag, at a trriliug ex pease. Wo hear of no sales worthy of note.

New Discorpriss,-Now discoveries havo been made East of Eumboldt, which, atcerding to reports are marvelously rich. If they are ans thing tiko what is renorted, we shall hear more from them soon. We are not given to sensation stems aud prefer to be a little behiad time, rather than to give ourrency to uare liable reports.

Sobscribe. - Are you a miner and not a subscriber to the Mining and Scientific Press? If so, you are an annual loser of many times the price of a year's subscription, particularly if you are engaged in quartz miniag. The same amount of practical information, important to miners and mechanics, which is contaiued in a volume of the Press, cannot be bought from the shelves of any bookstore in the country for the price of several year's subscription. Do you ever send a paper to the "Old Folks at Home?" If so, and you desire to send important information and valuable reading matter, you can find no paper that will be read with so much eagerness by them, or one that will convey to them so full an account of the real jadustry of the country as the Mining and Scientific Press. We invite all to send us their names and four dollars, or two dullcrs for six months, and become patrons of the only mining paper printed on the Pa-
cific coast. Those who receive a paper with this naragrinh cific coast. Those who receive a paper with this paragraph marked may understand that it is sent to them for examination, and with the hope that it may so for meet with their approval as to warrant their subscribing for it at once. It is not our usual enstom to receive a subscriber for less than
six months; but inasmuch as we are anxions to introduce six months; but inasmuch as we are anxions to introduce
the paper where it is not now known, we will, for the present, send the Press for three months even, on the recelpt of one dollar, in coin or stamps. It is our belief that no one will wish to discontue the paper after being a constant read er of it for even that short period.

## SUGGESTIUNS ABOUT FOREIGN PATENTS.

American inventors should bear in mind that, as a general rule, any invention which is valuable to the patentee in this country, is worth equally as much in England and some other foreign countries. Four patents-American, English, French and Belgian-will secure an inventor exclusive monoply to his discovery among one handred millions of the most intelligent people io the world.

The facilities of business and steam communication are such, that patents can be obtained abroad almost as easy as at home. The majority of all patents taken out by Americans in foreign countries are obtained through the Mining and Scientific Press Patent Agency. Having established agencies at all the principal European seats of Govern ment, we obtain patents in Great Britain, Frunce, Belgium,
Prussia, Austria, Spain, etei,; with promptness and disPrussia, Austria, Spain, ete., with promptness and dis-
patch. Models are not required in any European country, bat the utmost care and exper ence
the specifications and drawingse
Whe specifications and drawingse intend to tak out foreign patents, engrarings should not be published uatil the foreign applications bave been made.
Caution.-It has become a somewhat common practice for agents located in England to send out circulars soliciting the patronage of American inventors. We caution the latter against beeding such applications as they may otherwise fall into the hands of irresponsible parties, and thus be defrauded of their rights. It is much better for inventors to entrust
their cases to the care of a competent, reliable agent at home.

While it is true of Most Euronean conntries that the system of examination is not so rigid as that practived in this country, yet it is vastly important that inventors should have their papers prepared only by the most competent solicitors in order that they may stand the test of a searching legal ex: amination; as it is a common practice when a patentee finds a purchaser for his invention, for the latter to cause such examination to be made before be will except the title.

It is also very unsafe to intrust a valuable invention to any other than a solicitor of known integrity and ability. Inventors sbould beware of speculators, whether in the guise of pateot agents or patent brokers, as they cannot ordinarily be trusted with valuable inventions.

CORNS AND BUNIONS REMOTED.
DR. BTRON C. KENNEDY, practical Chiropodist late of Philadelphia, would most respectfully inform the citizens of San Francisco that he has opened his office at No. 12 Montgomery street, opposite the Lick House, where he is prepared to remove ail excresences, such as Corns, Bupions, Inverted Nails, Enlarged Joints, Swelled Insteps, Frosted
Feet, Ohilblains, Callosities, and all diseases of the Feet, withont pain or inconvenience to the patient.
Dr. Kennedy also attends to Ganglion, or Scorbutic Ul cers, and all otlier diseases of the Skin. He may be consulted at his office, No. 12 Montgomery street, opposite the Lick House, from 9 to 12 A. M., and 2 to 6 p. M. Having devoted six years of study to this important, but too much
neglected, branch of human knowledge, and having studied neglected, branch of human knowledge, and having studied Philadelphia, and having made this branch of surgical science my specia!ity for nine years, enables me to operate skilfully aud successfully. In England, Frauce and Austria the highest prizes are often awarded to practitioners in this branch of surgical science, and it occupies with others an equally lotly position in the profession.
Voizin is an illustrious example, a shining light, among the philosophical stars of Europe, and Dr, Byron O. Kennedy has fully equaled him in this country, as a proof of which the Faculty of the University College of Philadelphia, Pa.
Dr. Kennedy has bent his earnest
Dr. Kennedy has bent his earnest attention to the cure of these diseases, in which he has become so great an expert
that be is now regarded as the leader in this country, in this branch of the profession, throughout the United States.
The following letter, which emphatically speaks for itself, was written by
Dr. Brow C. Kexseny: Dear Sir-Learning that you are going to thlk
your departure for calfornia, and wishing to infornu the citizeus of lhaila

THE EYES! THE EYES!! THE EYES!/!

## DR. E. H. PARDEE,

Oculist and Aurist to the San Froncisco Deaf, Dumb
and Blind Asylum.

After a protracted blindness of wore than five years. Dr PARDFFE has made himself thoroughly and scientifically acquainted with all diseases of the Eye, and is now practic-
ing with a success that cannot be surpassed in the Enited States; and as proot' of this he substantiates by many case now in California that have been cured ly him, after having exhausted the skill of the eminent physicians and oculists of New York city, Boston and Philadelpha.
From an extensive practical koonledge years, Dr. Pardee asserts, and is prepared to prove, that there has been more blindness from bad aud imrroper treat ment than from disease itself-how can it be otherwise when we take into consideration the effects of the old hacknied course of local treatment lhat patients undergo-Caustic to-day and Bluestone to-morrow-more painul than death, daily presenting themselves with chronic cases, and on in
quing what bad beeu formerly done, the almost invariable reply is, "I had my eyes burncd with caustic or bluesfone;" I was bled and blistered, then cupped two or three times a werk-had a blue pill prescribed for me at night, and salt in the morning-was ordered in a dark room-to keep my
eyes tightly bandaged -to avoid the open air and exercise, with fifty other inconsistencies, the aggregate of which is sure hlindness. Patipnts should be careful and not place their eyes at the mercies of a man who docs nothing lut burn them daily. not investigating the circumstances of eac particular case, but ignorantly and blindy adopting and fol
lowing theories the most erroneous, and destructive to the lowing theories the most erroneous, and destructive to the
eye. How much more rational and consisient to consalt al experienced Oculist, who thoroughly understands every disease of this tender organ in all its aspects and varieties. Dr. daily superrision, aod. with but very few cases, they have all been treated by other physicians hefore applying to him-and all to no benefit. Those who are doubt ful are permitted to call at Dr. Pardee's office and confer with the many patients forenoon. The Dr. has a large and only assortment of Artificial Fyes on this coast, inserted, haviog all the movements of the real eye, and that they lork so life-like that no one can
tell them, when properly inserted, from the real eye. These eyes are sold reasonable.

All the operations performed, such as "Strabismus," or cross-eyes "Cataracts"-or removal of the Lens loy absolption or extraction;-" Plerygium," or fleshy membranes grow ing orer the eyes. Artificial Pupils, \&e.

## RANKIN'S IMPROVED SCHOOL DESE.

By the arrangement represented in the accompanying cut, two or more School Deaks are connected by a longitudinal beam or board, and frraly held together. The following advantages are claimed for this arrangement

1. The series of Desk thus formed atand very firm on the floor, without bein in any manner fastened to it.
2. They cau be removed at pleasure by adults, in a few minutes, with little or no expense.
3. They present fewer obstacles to the use of the broom than any desk in use.
4. They furnish mach less occasion for noise than other school desks, by presenting less surface for the feet to stike against.
b. They are superior also to other Desks, in regard to the convenience of getting in and out of them with ease.
5. The arrangment of the book-shelf, (as ceen in the front desk in the cat, where the writing board is broken array) by which a separate place is provided for the slate and atlas, and less room allowed for miscellaneous articles, has been found by experience to be a great conkenience. It saves noise and promotes neatness.
6. In appearance they are, neat and when properly made, even elegant.
7. The central longitudinal beam separates the two acholars in each desk, thus giving to the arrangement one of the principal advantages claimed for single desks.
8. They are simple in construction, and easily made "at home" by any good workman; put together with screws, can be taken apart and boxed.
9. They can be more easily adapted to particular tastes and circumstances, as regards height of seat and writing board, inclination of the seat and back, ete., than any that are supported by castings.
10. They are in general firmer and more durable than desks that require to be fastened to the floor by screws or nails.
11. They are much cheaper than any other good deskcosting, ordinarily, not more than one half as much.

That these statements are true, must be apparent to teachera and others who have had much experience in using and furnishing echool rooms ; and if they are true, it is equally plain that the advantages obrained by this arrangement are very great, and that it has good claims to the notice and favor of all who may desire to assist in improving the appearance of our school rooms, and promoting the comfort of pupils and teachers.

The desks, or the right to use this invention, will be furni:hed on very favorable terms on application to

Warren Holt,
305 Montgomery street, San Francisco.
Large Captral.-The Great Western Railway (Eugluad) is about amalgamating with two other companies, when the whole capital will pe $\$ 210,000,000$.

TEEW AND IMPROVED SCHOOX DESK. patented febreary 18, 1862, by J. S. pankin.
trust that they will sink deeper, so that it may become known whether we have our lodes running deep or not in that section of the State.
T'o the South of this claim, ground has been taken up in the name of the Oak Hill Mining Company. They are sinking a shaft here at a distance of about 500 feet from Dr. Newton's shaft, but as yet they have not struck any copper indications.
In the immediate neighborhood of this last mine there are two others sinking down upon the same indications. They are named Rutledge, and Doty claims The first shaft is the best workmanship that I saw in this camp. The Duty boys are working in very hard ground, but now and then the mundic contains specimens

NOTES ON THE COPPER MINES OF AMADOR
There are three distinct veins running through this. seetion of the country. The first is about three miles from Ione Oity, in the direction of Jackson, running in a Northernly and Soutberaly direction: According to reports thase veins or ledges as they are called, continue their course from Oopperopolis through Campo Seco and down to Clarksville in El Dorado. Some time ago I visited the two last celebrated mining eamps. But my knowledge of tha geology of the country, would scarcely allow me to come to the conclusion that in Amador County they have the exact ledges that are running through Calaveras County. But of this I am certain, that along the whole of this distance, the ground is taiken up for copper mining, and in many places a very considerable amount of work has been done. But very few, however, have been so successtul as to strike the copperbearing rock; still they have strong faith that they will soon do so, and no amount of dollars would induce them to give op their claims.
The first mining camp that I visited was that of Dr. New ton. He has out at his mine about 100 tons of fine ore. On this claim considerable amonnt of work has already been done; they have sunk down until they have arrived to the depth of about 170 feet. At the depth of about 90 reet they were so fortunate as to strike the copper-bearing lode, which was twelve inches in width, and down along the whole depth they have had moderately good ore. Sometimes the lode would seem a little less, but in a little while it would agrein swell out to eighteen or twenty inches. On descending the shaft I observed that in some places it had a width of two feet six inches. At the bottom of the shaft they have now two feet aine inches on one side and two feet on the other, of moderately good shipping ore. It will be observed from the above that this company have got a lode of
copper for the depth of about eighty. feet. Rather than give an opinion of the value of the above mine I let it speak for itself. It is evident that this mine is capable of being worked on a very extersive scale, if properly managed.
of copper pyrites that would assay some

## 10 or 12 per cent. of copper.

Having heard some time ago that there was considerable excitement toward Jackson, I resolved to visit this place; bot I could not find that any rock presented to me contained any indications of a copper lode. I was told that the whole belt of the country was taken up for five miles, for copper. I was on some of the ground, but did not see anything attracting to my eye.
The next district I visited was the one known as the "Horse Creek" district. There they have sunk about forty feet. The indications which induced them to strike bere were some green carbonate and silicate of copper cropping out. They have met with but very little success as yet. In one or two places, while sinking, they came upon some boulders of quartz, containing bunches of copper pyrites. I visited two more copper claims still in a southernly direction. They are respectively called the Reed Mining Co. and the Boulder Hill Mining Co.
On the other vein, called the Hornblend lead, about half a mile in the direction of Jackson, there are several claims taken up; but very few with any success. In oneinstance they say they have the sure thing, having struck good indications of a silver lode, the rock giving, they protest, all the acid tests of silver, viz. : dissolving in nitric acid, decanting the clear liquid-a copious white precipitate was formed, which precipitate was the teroxide of antimony and not chloride of silver. I found that several parties had fallen into the same error. Some time, Mr. Ebrror, in a future number, I will give you a few hints on the fallacy of the chloride of sodium put for silver.
The Randall is another claim which also promises to be a good mine. They have sunk here some twenty or forty feet and are now on a thick vein of mundic, containing considerable sulphurets of antimony and copper Some of the specimens I took up would as-ay about four or five per cent. in copper. They have to fight hard with the water at the bottom.
From here I went some miles in the direction of the Cossumnes River. I came to a Ranch called Stanley's Ranch. Here a fair company had been organized and had taken up
some 2,000 feet upon a ledge. The out croppings on this lead bring heavg masses of hydrated peroxide of iron containing small quautities of the green carbonate of copper. Several c aims had been taken up upou this leadboth in a northernly aud southernly direction. I visited two of the northeraly extensions, called Groat \& Walker Claim, and the Cussumnes River Clain. Both of these claims promise to turn out well. I saw some very rich specimens of the red oxide of copper and also some silicate of copper, reported to have been obtained from a claim on the extension of the Consumes River clain. There must have been considerable quantities of it, since. wherever I would go, nearly all the way from this place to Sacrauento, I found specimens of the same kind, all being reported as brought from the above mine.
There is also considerable excitement about copper ore in the neighborhood of Rich Bar. The copper here is the sulphuret very much mixed with quartz. The ore is of a very fine quality, but of very little value, as it is too much mixed with gavgue-probably the ore may concentrate as they sink down. About six miles from this place is a town called Puckerville. Claims have been taken up here, also on Gregg's Ranch. On one claim they have sunk down about six feet and have struck a very strong vein of mundic; but the mundic does not contain the smallest piece of copper

Thus ended my visit to the Amador copper mines.
If you travel along the hills, wherever you see a rock you will also find a notice that it is claimed as copper grouud. Should two per cent. of the taken up claims prove to contain copper in working quantity, Araador will soon become one of the richest copper mining countries in the world.

## IMPROVED SCHOOL DESKS.

We would call attention to the representation, on our firat page, of an improved School Desk, recently patented by J. S. Rankin. The enumeration ot its advantages, given in immediate connection with the illustration, fully sets forth its superiority over any other description of Desks in use. We have also seen testimonials of its great utility, signed by all the leading School Officials and Teachers in this city; also from the numerous prominent Teachers and others engaged in Educational interests in the Eastern States, where this Desk is being very generally introduced. County School Superintendents and School Trustees throughout the State should give this new School Desk a careful consideration. Its advantages in every point of view must be apparent to every one who will carefully examine it. Rights to construct the same can be obtained on reasonable terms by addressing Warren Howx, No. 305, Montgomery Street, San Francisco.

The "Notes on the Copper Mines of Amador County," which will be found apon our first page, were prapared by one of the most thoroughly practical Mineralogists in the State. We have the promise of further communications from the same gentleman-Notes upon other Copper Mines, and some practical articles on assaying and ore tests, which will be found, very valuable to the miner, and prospector.

Ctass in Ceemistry and Assaylvg.-By reference to a card in our advertising columns, it will be noticed that a gentleman of this city proposes to open a class for iustruction in Chemistry and Assaying. The gentleman is a man most emiaently qualified for taking charge of such a class, having had long experience as a practical Assayer and Chemist.

A rare opportunity is here presented for persons engaged in' or contemplating any counection with mining enterprises to acquaint themselves thoroughly with a knowledge of minerals and their resulting metals.

Map or Sinaloa.-We have received from Henry Payot No. Washington Street, a finely executed Map of Sinaloa, Mexico. Sinaloa is located immediately be'ow the State of Sonora, its Western boundary resting upon the Gulf of California and its Eastern extending just beyond the Coast Range of Mountains, some 35 or 40 miles inland. These mountains are highly metaliferous, and contain a great number of abandoned Mines which are now being reopened with great encouragement of future success. Parties interested in that section, or desirous to become acquainted with it, should provide themselves with a copy of this valuable Map.

## MINING EDUCATION

In the leading article of our issue of the 9th inst. we introduced an extract from a paper communicated to the Casiformia Mining Journal, some three years since, and entitled "The Advantages of an Extended Knowledge of Mineralogy to the California Miner," by M. Attwood, Esq., of Grass- Valley, wherein the writer expressed his belief, founded upon scientific duta, that importaut discoveries in other metals than gold, would soon be made on this Coast. The discovery of silver, soon afterward, an the Eastern Slope, and subsequently in various portions of this State, added to the still more recent, and wouderful discoveries of copper, have most remarkably verified the correctaess of his prediction, and afforded additional evidence of the value of science in the mines. Since the issue aforesaid our attention has been called to a communication in the Sacramento Uuion, under date of Nov. 2, 1859, in which the writer quotes a portion of a private letter written by Mr. Attwood, a short time previous, giving the result of his observations while on a visit to the Ophir Mine. We give the extract:
I did not make as careful and clnse an examination of the ground abore the rein as I could have rished; indeed, from the confusion existing, and from one formation passing into another, to work out the geology properly would require time. The course of the vein appears to be a few degrees west of magnetic north, dipping westward at an angle of about forty-aight degrees, bud the dip being a fulse one, you may not sink far before it will change. T'o the westward of the vein, and at no great distance, is a large 'dike vein,' (the upper quartz ledge I mentioned in my correspondence) [now known as the "Virginia Ledge"-Ed. Press| the direction of which is parallel with your veiu, but the inclination or dip, contrary, or to the eastward, ss that your veiu might continue its present dip westward till intersected by the Dyke vein. The formation adjacent to the vein is a partially decomposed felspathic pophyry.
Mr. Attwood is a mining engineer and mineralogist, and thoroughly acquainted with every department of mining engineering. His knowledge in this department of seience enabled him to agria predict the existence of a fact in 50 gard to the Ophir mine, burried several hundred feet beneath thie deepest opening at that time made, and one directly contrary to every surrounding indication when considered by an unscientific mind. Without any hesitation, he wrote at a time when the mine had only been opened to a depth of about 15 feet: "The dip [of the vein] being a false one, you may not sinle far before it will change." Since that date, upward of three years have passed away and the workmen in the Ophir mine have gone down to the depth of 210 feet and demonstrated the exact trath of what the application of science to an undeveloped mine had foretold. It is now known that the Ophir mine which dipped at the surface about 48 degrees to the West, has in less than 200 feet changed its dip to about 60 degrees East. In other words its present dip at the lowest point reached is nearly at right angles with its dip at the surface. This change in the angle of the dip has caused the extraordinary dilated appearance of the vein in the middle and lower galleries.
Had the Ophir Company at the outset of thir worl determined to sink a shaft, say 500 feet deep through which to work their mine, and employed a man not thoroughly skilled as a mining Engineer, to locate the same, he would most undoubtedly have been governed by surface indications and located the shaft at a point, from which at the required depth of 500 feet he would have found himself several hundred feet distant from the vein after arriving at the point where he expected to intersect it, and constantly increasing that distance as he progressed downward. Thousands of dollars are annually thrown away by the miners of California from the lack of proper engineering knowledge in this very matter of locating shafts and tomnels. Millions of dollars have been thus uselessly expended in the English mines, and it was not until quite recently, and after the most earnest appeals of scientific men to mining adventarers in that country, and a presentation of the convincing facts of cuormous losses proven to have arisen from a lack of proper mining knowledge, that the adventurers could be induced to employ competent and properly educated men as mining engineers. As late as $1836, \$ 50,000$ was expended in sinking a single shaft for coal, near Northampton, $a^{2}$ a point where even the most superficial knowledge of the dip of the strata, would have proved the impossibility of success. The first shaft
suak at the Haswell colliery by. inexperienced adventurers was abandoned alter axpending $\$ 300,000$. A scientific surrey subsequently pointed out the true locality for "ainking, when the work was recommenced and resulted in a com plete success at a trifling cost, in comparison with the first attempt. Numerous other particular instances involving perhaps less pecuniary losses than those above enumerated might be poiated out, which have proved equally- barren of results, from this some persistency in ignoring tho utility of of a proper edncation, on the part of those entrusted with mining engineering.
California, or rather the Pacific Slope, is just entering upon a fystem of mining erterprise, which in extent and value will soon vastly exceed that of any other portion of the globe; and the question is certainly a most pertinent one whether we shall call to our aid the collective experience and wisdom of the past to assist us in the enterprise, or whether we shall go on, as we thus far have done, and still insist in hindly incurring the heaviest pecuuiary penalties for the want of adequate geological and mineralogical knowledge, T'he merchants and capitalists of San Francisco, who do not own a dime in any miniag enterprise are deeply interest ed in this question, from the fact that the more successful we are in our mining operations, the more rapidly will they extend, and in the same ratio build up this city and increase the value of our trade and trafic and our investments in real estate.
You who are venturing your hundreds or thousands of dollars in the various mining operations of the day are most deeply interested in the question. Are you willing to in trust operations in which your capital is involved, to incompetent hands? Would you not, rather, while we are yet in the infancy of mining operations, contribute something from the State's revenne, if necessary, to prepare those upon whom the future direction of our mines are to devolve, for a proper management of them? We may get along passably well with the few competent men we now have among us, perhaps for three or:four years, or until we can establish a proper Mining School and send out a class of graduates who will be fully able to undertake the management of such mines, as are growing more and more complicated in their characteristics and developments, and, as a consequence, all the more in need of experienced and skilful men to take them in charge.
It is our intention to still continue the discression of the important question of Mining Education, and in fature numbers, we shall endeavor to lay before our readers, some practical plans for the establishment of schools where the science of mining-practical as well as theoretical-may be taught.

It would afford us pleasure to bring these facts to the at-1 tention of our Legislators, bat the inclination of the legislative wisdom of the State seems to be turned to other channels than a study of our great leading interest-at least, it is so, if we are to judge them by the selectiun of newspaporial reading furnished by the State's liberality, in which the only exclusively mining press in our State has been almost eif tirely ignored. In this great matter of State interest, orie of more vital importance to the commonwealth than any other which is likely to come before the Legislature during the balance of its session, not a single paper except the Press, has yet uttered a word. We intend to send a few copies to the Legislature gratis, while we are dissussing this matter, hoping they may be received kindly, even if the subject to which we desire to call their particular atitention may not be considered of sufficient importance for Legislative ac tion.

## WASHOE MINING CASES.

The following Mining Cases now pending before the First District Court, in Nevada Territory are set for trial as fol

Feb. 20-Calilornia Co. vs. Charles Anderson et als
Mar. 10-Robert R. Moss vs. Grould \& Curry Gold ani Silver Mining Company.
Feb. 27-Frank Perkins vs. Sierra Nevada Mining Co
Mar. 12-Cbollar Silver Mining Company vs. D. S. 'Tur
er.

Mar. 6-La Crosse Mining Company vs. Burning Moscor
Mining Company.

## MINING AND SCIENTIFIC PRESS.

 his head in another colume, wa put in type we have noticd an asticle in the Evening Bullefin, showing that the nost cred table dengre of industry has beren materested hy he members of the survey in pro ereuting the work comtmit ind to thoir charge. Survegs have alraaly heen mule in all lu. counties of the state hit seven. The publication of the Reports and Maps how in ustate of great forwardness, cannot be made until the proper appre priations are made therefor 20,000 is now due the Surwer for moneys already nppropriated, lut not paill for lack of fuuds. The field work during he last year has been carried on by Mr. Whituey at his own ndividual expense and there is now due him $\$ 15,000$ for uch services. Tho Duelletin sixys:-
The time when the first anmual report should have been farle was at the meuturg of the Locrishature last year, but the Act was then amenderl, and Mr. Whitney authorized to fombine lis first and secoud reports into one, and lay the ame thefore the present Legrishture, and $\$ 3,000$ wits a pproriated for publishiner 1,000 copies of the said reports. Ow-
to the vacum in the State 'Trensury, however, so fur as
eeting the reguirements of publishing the geal gical suroy wa : concernerl, not a dullar of the above approprintion as yot heon receivel by Mr. Whitney; consequently there ill be no reports this year.
We trust that the couclusion of the Bulletin may prove correct. The matter will soon come before the Legislaure, and it is to be hoped that body will devise some means o spread before the people the valuable facts collected by he Survey.
Improyrd Stanit Bohler.-Joseph Harrison, Esq., of hiladelphia, has recently invented and patented a steam viler, which, it is said, is commanding high favor among ngineers. Mr. H. was a partner of the Winans Brothers, Baltimore, in their contract with the Russian Govern nent fur keeping in repair the great railroad from St . Pewsburgh to Muscow. He is now in Europe, whither he as been called by several skillful mechanics with the view the iatroduction of his patent boiler on that continent.

## SAN TRANCISCO MINING NOTICES.

## ASSESSMENTS LETIED.

Assessments upon Mining Stock have beeu levied as fol
Caledouia G. \& S. M. Co. levied an assessment, Feb. I f 50 cents per share, payable immediately. Sale ol deliuent stock will be made March Tth.
Moss G. \& S. M. Co.-An assessment of 50 cents per hare was leviud. Jan. 27, payable at 428, Moutgomery St. r to the Superintendent at the mine.
White Cloud G. \& S. M. Co. levied an assessment o 5 cents per share, Jan. 27, payable to the Secretary, at 28, Montgonery s't.
Warren G, \& S. Mining Co.-An assessment of 75 cts share was levied Jan. 26, payable to the Supt., at Viagia City, or to the Sec., 428 , Moutgonery st.
Warren G. \& S. M. Co.-An assessment of 50 cents er share was levied Jon. 27, payable to the Sec. in this ci$y$ or to the Supt. at the mine.
El Dorado G. \& S. M. Oo.-An assessment of One Dol ar per share was levied Jan. 23, payable to the Sec. or to he Supt.
Gaudaloupe S. M. Co.-An assessment af $\$ 30$ per share Gaudaloupe S. M. Co.-An assessment
vas levied, payable ou or before March 1st.
El Tesora Mining Co.-An assessment of \$11\% was leved Jan. 27, payable at office on or befora Feb. 27.
Polar Star G. \& S. M. No. levied an assessment f 50 cents per share, February 4th, payable ou $r$ before the 4th of March, at the Uffice in this city or o the Superinteudent at the mine in Aurora, (Ésmeralda.)
Dios Padre G. \& S. M. Co. Ievied an assessment of 3 dollars per share, Jan: 31, payable in 30 dayss, alsu an assessment of 2 dollars per share, payable in 60 days, at office 502 Montgromery street.
Beckwith G. \& S. Mining Co.-An assessment of 25 cents per share was levied Jan. 24, payable immediately.
Sonora Mining Co.-An assessment of 25 cents per shave was levied,Jan 23, payable immediately.
Overman Mining Co.-25 cents per foot, Jan. 29, payable within ten days.
Chs. Caney Miving Oo, - 50 cents per share, Jan. 2I, payable on or before Feb. 20th.
Adriatic.- Fifty cents per share, payable at No. 4 Armory Hall, San Francisco, or to the Superintendent at the Mine.

Ihattie G. A. S. M. ('o.-Thirty cents per share, hevied Jan. 31, payable at Onfee in San Francisco, or at tho Mine. Hala if Noreoo-s-Anansment of Ten Dollars per Share hevied Jan : :3-payable at the Uthice in this citg, or dulmsike, at the Mine, un or lefure Felo. 2s.
Sierrat. M. Co. An Assessment ofミ!! was levied Jan. $2 \because-$ payahle immediately, at Ulfice 575 Jission St.
Mount Davireon Co.-An Assessment of 50 cents per Share was levied. Jan. 23. jriyable on or before March ist at Ufice 47 Muntromery bluck.
Mina I'rietas S. M. Co.-An Assessment of Five Dollars per Share was levied, Jan. 31, payablle ou or bufore Marcl Sth-at Ofice, cor. Montgumery \& Jackson Sits.
Recorder Mining Co.-An Assessment of One Dollar per foot was levied Jan. 19, payable half on or before Feb. 18, and Ualanea on or befure Marcls 20.

Hale \& Norcross S. M. Co have levied an assessment of 5 per share payable on or before Jan. 26tb.
Martin White.-An assessmeat of 20 cts. a share was evied, Jau. 2.
Orieutul G. \& S. M. Co.-An assessment of 50 cts per share was levied. Jan. 14. payable at Office, cor. Sutton Arenue aud C St., Virginia C'ity.

Bultimore America Consolidated.-Anassessment of 50 cents per share was levied, Jan. 5.
Savage.- $\Delta \mathrm{n}$ assesswent of $\$ 35$ cents per share was leved, Jan. 7.
Hawley.-An assessment of 25 cts. per share was levied Jan. 5, payable in 30 days.
Cole S. M. Co.-An assessment of One Dollar per share was levied, Jan. 10, payable, Feb. I.
United States M. Co.-An assessment of six and twothirds ets. per share was levied Jan. 10, 1863, payable to the uperintendent at the mine, or to the Secretary, Rooms and 8, Government House, San Fraacisco.
Sierra Nevada S. M. Co. levied an assessment of $\$ 15$ per share, Jan. 15—payable Feb. 18.
Lady Bryan.-An assessment of 70 cts . was levied, Jan. 13, payable on or before Feb. 16.
Ida G. \& S. Co. (Russ District)-An assessment of $\$ 1$ was levied, Jan. 14.
Red, Wate and Bute G. \& S. M. Co. levied an assessment of 25 c ats per share, payahle on or before Feb. 1st, office cor. Pine and Montgomery Sts.
Mina Prieta S. M. Co.-An assessment of $\$ 10$ per share was levied, Dec. 26, 1862-payable at office, cor. Montgomery and Jackson Sts., on or before Jan. 26, 1863.

## ASEESSMENT SALES.

Sales of Stock for non-payment of assessments are advertised to bo sold as follows :-
North Potoci Mining Co.-Sales delicquent stock will be made March 17.
Peytona G. \& S. Mining Co.-Sales of delinquent stock will be made March 1st.
Cole Silver Mining Co.-Sales by Jerome Rice \& Co., 327, Montgomery St., San Francisco, on the 25th of February.
Combination G. \& S. Mining Co.-Sale by E. S. Spear \& Co., at 433 California St., on the 10th day of March next.
Lady Bryan G. \& S. M. Co.-Shares of delinquent stockholder's will be sold at auction for assessments, at No. 400 , Montgomery steet, on Jan. 27.

Desert Mining Co.-Shares of delinquent stockholders will be sold at auction, fur assessmrnts, at No. 400, Montgomery street, Jan. 27

## general notices.

Caution.-D. M. Tyrell warns persons arainst purchasing certain 10 feet of ground in the Wellington Co., standins in the name of J. B. Magree-also 20 feet, standing in name of W. Williams. (See Territorial Enterprise.)

Ashland Co.-I. A. Gould, in the name of the Moss Co. notifies the Ashland Co. that their westerly drift has cut the Lamb ledge, in the Moss Co.'s ground, from which the Ashland Co. is forbidden to extract any valuable metals.

Coso Silver Mining Co.-The Office of this Company has been removed from the Stevenson House to Nos. 11 and 13 Court Block, No. 636 Clay street between Montgomery and Kearny. Entrance on both Clay and Merchant streets.
Henry Martin G. \& S. M. Co.-"Thomas Wallace, Trustee." gives notice that whereas certain parties illegally claimtee. gives to be Trustees of this Company, have changed the name of the Corporation to the North Star G. \& S. M. Co., and illegally elected officers for the same, the public are cautioned against such acts, etc.

The Swmasy Co., (iold Hill, give notice that Paltic Company have wrongfuly clamed and norked their ground since July, 1860.
(Thak Vumarey Rock (oo., lying next weat of the Tirpinia Co. clains have notifind the 1lazd liretn. 'l ingley and Dach di l'axton ('onmange that they are tresparsing upon the Chimaty liock Cós gromad.

## ESMERALDA MINING NOTICES.

Tue Zencma Lode Comicans, give notice that they chaim 2 fupenior title to the Johneon Co.. cluming the same ground, so far us said luenlities conflict. This ground is a jortion of that now held by the Company known as the Wide West Company. The notice is signed by A. Wi addell, J. U. Dorsey, S. P. Dors y and James Elder,

Ore Tests.- Several inquiries have been made to us of the different chemical tests that will discover graces of silver and copper in the rock. If our friends who are conversant with this matter will forward information respecting such chemical tests to us, we will be hapny to gire them publicity. [Amador Ledger.

Persons interested in the above wi!l find the desired information, and much more in the same connection, all valuable to copper and silver prosnectors, in late-yumbers of this paper. A remittance of six months or a years subscription to the Mining and Sorentific Press, will afford them all the valuable information obtainable from books in relation to prospection for cither silver or copper, and assaying and testing ores of the same. The dissenination of that class of information is the speciality to which this paper is devoted, and no mineral prospector in the silver and copper regions of California can invest $\$ 4$ to better advantage than by seuding the same to this office and becoming a subscriber and reader of the Press. We shall be extremely happy to receive the names of all who may favor us with cash patronage. We also pledge ourselves at the expiration of the year to refund to any party double the amount of his subscription, who may honestly think he has not got the worth of his money in valuable information from our columns.

## MINING AND SCIENTIFIC PRESS.

## THE ONLT MINING, MECHANICL AND SCHENTIEIC Pareir on this contynent.

THIRD YEAR: VOLUME VI.-NEW SERIES!
A uew volume of this extensively circulated paper commenced Sept. II, 1802. It is intended that every number shall be replete with information
concerning Minint, scientific, Meclinuical und Industrual pursuits, together concerning Mining, scientifice, Mechanical and Industrul pursuits, togethrer
wifl seperal origiual engraviugs, of new iuyentions, etco, propared ©xpressly for ita columms.
This paper is devotell to the above purposes, thgethor with the interests of Science, Arts, Agriculture and Cumamerce, and any gelieral information that may be of intersst to the reader : and it is the intentiou of the proprietor to spare no pains or expeuse in makiug it equal in juterest and valuablo

## The Mining Interest /

Will find it of great ralue, as it will contain all the newe appertaining to Mining, the prices and sales of Mining Stncks, new inventions of Machiucry adapted to that purpore, and of everythag gencrally that may be of service to the Miner.

## The Inventor 1

Will end it an excellent medium for the parpose of bringing his invention into aotice, of ascertaining the progress of invention in this and othor
countries, and also of recriving any information that maty be necessary countries, and also of receiving any information that maty be necessary Patent Agent, togother with fucilities a ain Patunts with dispatel.

## The Mechanic and Manufucturer \$

Will be greatly benefited by its perusnl, as cach number will contnn aoveral origrail engracings of now maxclitues aud inventlows, togethur wilu a large anonit of reading taater apper tainmg thereto. We are constantly receividg the best scientidic journals from all quartere, from whieh we
sianll continuo to extract whatever maty be of Wenefit or interest to our shall cont
reuders.

To Chemists, Architects, Millwrights and Farmers !
This journul will be invaluable. All now discoverics in Chemistry will be givou, and a large amount of iuformation of great service to Architects and
Millwrights will be found in our columns. The Farmers aud Hlaiters will Millwrights will be fuud io our columns. The Farmers nud Flauturs will
oot bo neglected, engriviugs will be given of agricultural implements, and the farming interest gonerally will be amply discussed.

Torms.

## Club Ratcs.

Five Copics for Six Monthb, $\begin{gathered}\text { Clib } \\ \text { S8. }\end{gathered}$
Five Coppiss for Six Months, $\$ 8$.
Ten Copies for Six Montbs, $\$ 16$.
Ten Copies for Twelvo Mouths, $\$ 30$.
Ten Copies for Twolvo Months, $\$ 30$.
Fifteen Copief for Twelve Montus,
Fifteen Copies for Twe Tve Montss, $\$ 44$.
Twenty Copres for Twelvc Months, $\$ 56$.
For all clubs of Twenty and over, the yearly subserintion is only $\$ 280$ Nimes cau bo sent in at aifient tuouss and trond differeut Post-offices

An Interest in one of the most fournshing and best paying Newspa per Offices in the mountains is nffered for sale no easy terms． A rare op
lishing bim portunity is hereby preseuted to any printer desirous of entablishing bim self in a good bosiness in one of the healthiest，most thriving and delight ful mo

MINING－T．EGITIMATE，SPECULATIVE AND SENSA TIONAL．

Under the most favorable circumstances，and under the best and most legitimate management，mining for the pre cious metals，including copper，must be essentially specula－ tive．No amount of knowledge，either theoretic or practi－ cal，or even the most judicious combination of the two，can at all times tell us where the ore is；indeed we can only ap－ proximately know where it is not，beyond actual exploration We can only say，in view of any contemplated operation， ＂there is a strong probability that there is a rich miue here or there－or there is bat little prospect that oue will be found in this or that locality．＂The very nature of the busiues renders it specalative．

## legitimate mining．

Ordinary miniog adventure，to be legitimate，should be kept within certain recognized limits．Notwithstanding the great uncertainty necessarily attendant upon all mining un－ dertakings there are，however，certain principles accepted －the resalts of the experience of ages－which，although they may be without the limit of perfect scientific deffini－ tion，and consequently subject to no fixed laws like legiti mate commereial transactions，still they are capable of con－ stant application，and，when judiciously applied will approx－ imate mining adventure very nearly within the limits of cer tainty．Legitimate mining can no more be held responsi－ ble for the failure attendant upon anskilled or speculative operations，than can legitimate mercantile transactions for the wild and disastrons operations of visionary specalators．
Mining，however，being，as we have already stated，neces－ sarily speculative ；in isolated operations，of course，those who adventure，if reasonable men，will be prepared to in－ cur oceasional losses，where they bad most confidently 1 ok－ ed for the fullest success．Taking，however，the class of le gitimate operations in any given district，as a whole，the re sult will aniformly show very large balances of profit It is in consequence of this very fact that mining everywhere be comes such a froitful field of speculation．Brilliant mining successes can find no parallel，in their ratio of profit，in any other industrial pursuit．
Of course the chances or prospects of any proposed ad－ venture must be，to a certain extent，a matter of mere arbi－ trary opinion，and upon which even those most competen to judge must be expected to differ．In a matter where mere opinion enters so largely，and where the limits of probable success are so incapable of deffinition，it is natural，that even the most careful adventurer should often involuntarily slide into a grade of

## speculative mining．

Speculative mining may be represented as a＂sliding scale＂of operations graduated all the way，from a nearly legitimate undertaking to one eatirely devoid of principle， and so reckless in its character as to render absolutely crim－ inal anyattempt to enice into it an outside or not thor oughly posted party．This is the class of operations most detrimental，in its general results，to legitimate mıning，and the one which involves issues of the highest importance to
the growth of all mining enterprise．Speculative mining， of the most uncertain character，is ofteu opeuly entered up－ on in good fa th，by the adventurers，ia respons－to the mor－ bid gambling propensiti．s so deeply eugrafted iu human na－ ture，everywhere．This reckless class of miuing，although it may be conducted openly and fairly，with a full disclosure of the vastly preponderaling chances against success，is nev－ ertheless，most peraicious in its tendency－the brilliant suc－ cesses now and then attending it，operating like the leading prizes in lottery schemes to iuduce thousands to invest their last dollar in a＂chance，＂hoping that＂luck＂may favor them for once．
Speculative mining also includes that peculiar class of op－ erations which are gotten up like Peter Piuder＇s Rasors－ to＂sell．＂These mines are usually merely nominal in char－ acter．They sometimes have a locality on some wild cat ＂extension，＂sometimes not，in which latter case they are purely ：peculative，with a mere paper existence－nothing more，nothing less－just sufficient to give the concern a le－ gal existence upon the record．Such things always have， and always will exist，so long as legitimate mining affords a basis for such illegitimate operations．Operators，sellers and buyers in such stocks are to be classed with thimble riggers and the＇r dupes．Honest m．a will not engage in them．Intelligent men cannot beduped by such shallow pretences．It will be a long time ere the world will be pur－ ged of villians or fools．

## ＂sensation＂mines．

A new class of bogus miniug has come into note，which has been most aptly termed＂sensational mines．＂To manage well a sensational mine requires considerable tact and judg－ ment．It must also have a certain extent of substantial ba－ sis on which to be＂managed．＂The mive is usually a piet－ ty good one，and one which，if its mineral value should be ks pt within proper bounds would be a productive one to work．But the＂sensational＂operator has no idea of work－ ing his mine－not at all．He has struck a＂good thing．＂ His knowledge of mining assures him that it is but a＂pock－ et＂or＂chimney＂or mere chance and limited deposit of some kind．His purpose is not to sell a mere worthless thing tor a large sum of money－but to sell a＂good thing＂ for five or six times what it is worth．Having decided upon his＂base of operations，＂the sensational operator begins by calling attention to his wonderfal＂discovery，＂which to the judgment of the inexperienced outzider does really appear most wonderful．Such being the case there is no difficuly in obtaiuing favolable reports，from even very reepectable ageuts．By the various means of puffing，exhibiting speci－ mens，etc．，an excitement is easily gutten up and daily in－ creased as the number of buyers is angmented；each new purchaser becomes in turn elated with his fortuaate speca－ lation，until the shrewd originator of the scheme has got rid of all his stock．Of course when a working company has been fairly organized and active operations，commenced at the mine，the bubble bursts．
Under the head of Sensational Mining should also be ranked the＂Bulling＂and＂Bearing＂operations so common among Brokers and others in every unportant community， where stock operations occupy auything like a pruminent position in business transactions．Instead of aeting simply as brokers and advising their clients to buy or sell in what－ ever they cons der advisable within the range of mining ad－ venture，it has become a nut unfrequent practice among this generally useful class of mea to combine together in cliques for the purpose of working up to＂sensational＂prices certain stocks，for speculative purposes．We fear that such trans－ actions are not altogether unknown on Montgomery Street．The facility with which this may be done is well known to the＂initiated．＂Perhaps this class of sensational operations is as frequently resorted to as any other，and rarely fuils of being successful，when properly managed． This evil is not of recent growth．Both here and in Enrope it has been a source of heary and grevious injory to legiti－ mate mining operations．Evils of the various characters which we have passed in brief review are unayoidable in any mining community；but however much they may effect iddividuals they should never be clarged to the account of regular operations．Mining as an investment，when confin－ ed within its legitimate limits，will show quite as large bal－ ances of profit as any other business，and as a source of na－ tional wealth and strength is secood to no other industrial tional
pursuit．

## THE STATE GEOLOGICAL SURVEY．

We understand that a determined effort is to be made in the present $L$ gislature to deleat the anamal appropriation for the contimuance of the important work of the State Geo－ lugical Survey．As an evident feeler in this direction wo notice a communication in the Evening Bulletin，of Wednes day last，complaining of the apparent inaction of the com－ mission，and more than intimating that no practical results are to be derived therefrom．The writer may be honest in his conclusions，but if so，he is evidently misinformed as to the magnitude of the work before the Commission，and the time required to collect and classify the observations，in suctr a manner as to bring out the practical information sought for in its establishment．Considering the influences under which Goverument appointments are asually made，the invar riable system of favoritism which almost universally obtains we have reasons for believing that the State has been most fortunate in securing the services of the eminent gentlemari who stauds at the bead of the Commission．By general ac－ cordance of the scientific world Mr．Warrington Smyth， of England，and J．D．Whirner of the California Survey， rank respectively，as first and second，among living men iil the particular sphere of practical geolngy－especially as ap－ $p$ ied to mines and mining．The State of California will take a most un＇ortunate step backward if it fails to continue， to a complete issue，the work which we believe has been so systematically commenced by Mr．Whitney．Oar people and the Legislature may rely upon it，no irritating system of derrogation，or dread of being charged with dillatoriness，or ＂theorising，＂will deter this gentleman，so long as he holds the position to which he has been assisgned，from proceeding． with his work in a manner commensurate with the impor tance and intricacy of the undertaking．He will exercise his own judgment as to the time and means proper to be employed in the collection and registration of facts－often of the very least importance when isolated，but，when ary ranged and brought to bear one upon another always den veloping the moit important truths．Without this system of a careful generalization of accumulated facts involving， time as well as study，no real advance can be made in sci－ entific research．Anything short of this would be merels the work of amateurs－unsatisfactory，unreliable，and of no practical value．We have no knowledge of the actual con－ dition of the work at the present time．We found our it ferences of its favorable progress apon the well known practical and scientific reputation of the gentleman at itsi head，and his equally well kuown devotion to his favorits science，and untiring industry in everything which he under－ takes．We have never met the gentleman，or exchanged word with any member of the Commission；but we hav understood from other sources more or less in intimate rele tion with the Commission and fully competent to judge its progress，that a valuable report is now in the hands of th State printer or on its way thither，through the Legislature which will give as full a detail of the labors if the Com mi－sion thas far，as the nature of the work will admit． We understand that the English Government has decide to order an early geological survey of British Columbia If our Legislators should be so penny wise and poand fool ish as to dise ntinue our survey，we would suggest to tha Goverument the propriety of availng themselves of the tal ent and experience which，we in our foolishness，may thrusi aside．Indeed，we anderstand that correspondence to that end has already been unofficially inaugurated by our Britisl neighbors．
It should be borne in mind that if this work is suspendei at its present stage，its re－umption by another Commissio would have to be pretty much de novo；very little aid woulc be derived from the unfinished labor thus far performed And as the work must，in the nature of things be carrie tbrough at no very remote day，it would be well for oû economising Legislators to bear in mind，that，under auc circamstances the money thas far expended would result il very little if anything more than nil．If retrenchment mus be resorted to we would suggest that namerous other an less important matters might be dispensed with．Perhas the Commission，in its present stage，and under our existin condition of present taxation，might be somewhat curtaile in the number of assistants，etc．；but，for the credit of tb State and the furtherance of its chief industrial interest， 1 say nothing of the advancemont of science，we sincere！
trust this important undertaking will not be completely sot uside．Better thougs aro expected of Califurnia．Nature has made heran especial faverite by implanting within her capacious busom treasures the most varied，rich and impor－ tant；and with a jrufusiun nowhere slose to be fund tbrough－ wut her dominiums．We shall be falso to our intereats，fulse to our destivy，and unwruthy the reputation we have thus far furly merited of being the most energetic and progressive community on the globe，if we take such an inglorious step backward．

## GENERAL MLNLNG STOCK REPORT．

## REPORTUE SALES

At the San Franclaco Mining Stock Board， For the weck cuding Hebruary 21,1863 ．

|  |  |

| ｜ 1 \＆ | Fridag． |
| 出111 | Satardap． | San Francizco，Fobruary 23th， 1863. stock remarks．

The Mining Market for the wsek just closed has has continued to manj－ fost the fair degree of activity noticed on the weok previous．The disposi－ tion to operate iu second and third class stoeks also contiunes，rad exhibits evou an iacreased earaestress．The constantly increasing interest in，and attendance upon Mining stock Salce，witb the large amount of capital seck－ oporations，whicil cannot fail to oxert a most health frul iufluence upon that
 past week first class stocks have beco almost eutirely ignored，
Opbir has been scarceiy touched－no aales appearing．Wo quote but a single tran saction．
Goutd \＆Curry has plenty of buyors but no sales－not a foot has changed
hands this week． hands this week．
Clollar remains arm at nbout last quotations．Very little stock in the market．We undorstuad that $\$ 000$ is freely ufferod on the street without sellers，although the bids at the Stock Board for the week have varied from $\$ 500$ to $\$ 570$ ，closing at $\$ 525$
$\$ 500$ to $\$ 570$ ，closing at $\$ 525$
Fotosi has improved about $\$ 30$ ．Sacramento has advanced $\$ 20$ ．Both these slocks are in demaud at quetations，with but litto in the market． Burning Mossow has boon quito a favorite during tho weok．It has vanced from $\$ 7 \pm$ in $\$ 710$ ，and closes the week with an upward tendency．
Burninido has also become a sulden favorite in this market，advancing from $\$ 22$ ，on Mooday to $\$ 70$ on Thursday．It contiuued fluctuatiog from that time till Saturasy eveniog when it stood at $\$ 50$ ．The cause of this move－ meut was a tolegraphic dispatech announcoing new and importnat develop－ ments at the mine．
Hount Davideon，which has for along timestood at from \＄to \＄4\％，has takels an upward novement and closed the week at \＄6．Work upon this mino is being very energetleally prosecuted，and still further advances mayy
bo confidently expected，at an early day． bo confidenzly expected，at an oarly day．
Fssermald Stocts still contiouo to claim
Fsamernad Stocrs still continuo to claim a large alhare of attention．The
Wide West bas made a material advauce，going up about $\$ 40$ ，One sale has been made the past weets at $\$ 400$ ，half cash，bulance in 60 days．Other quo－ tations from tbis district remain at about last week＇s figures．
Coso Mysks remain ut aboat last weeks quotations Transastions light． mexican Minss arb but little dealt in．Miua Prieta is quotod at $\$ 135$ ，and Dios Padrae at 340 ．The former of these companies has a very superior of two manths．
The machinery for the Dios Padre，we believe，is now upon the ground and in process of crection．There are many other mines in the vicinity of the alove which we presume will soon be heard of in this market．

## VIRGINIA CLIE NTOCK LIST．

## WASHOE STOCK REMARKS．

［Compleed yrom thes Dainy Terkitorlal Entbeprise．］ Monday Evening，Feb．9， 1863.
There has been a decided activity in stock to－day．Miniog claims are in demand with an upward tendency，which have heretofore been unsaleable at any price．A discovery－supposed to be silver ore－bas been made at
Steamboat Sprigg．Tive feet of Buchanau，sold to day，at $870 ; 20$ of Un－ ion at 13； 20 of Dunn at $7 \frac{1}{2} ; 10$ of Sacramento at $65 ; 60$ of Wellington re－ ported sold at 20 ．The latter Company has been consolidated with the Easteru Slope Co．，under the name of the Wellington Compan
derstood trat immediate steps will be taken to incorporate．

Tukeday Evening，February 10th．
Allen is enquired for and saleable at from $\$ 40$ to 45 ；Sierra Nevada is in demand af 70．This stock generally finds its way to the San Francisen mar－ ket．But litto is held or offered here，Sacramento is in demand at $\$ 56-$
nume being offered．Utah is offered at 50 without sales．Several Zouave are reported sold at 6 and $6 \%$ ；；there will urobably be some domand bereatter for thin stock，the Company having taken stops to resume opera－ tions on the claim，and also to incorporate．The Hazel Green Company are reported to have struck good rock in the face of their tumael．The Banner
Company are preparing to fucorporate．A new discovery on American Flat Company are preparing to jucorporate．A new discovery on American Flat
is reported，supposed to be rich．Ten leet of Sierra Nevada sold at $70 ; 20$ is reported，supposed to be rich．Teo leet of Sierra Nevada sold at $70 ; 20$
or Duen at $7 ; 10$ of Union at $12 / 2 / 25$ Birdsall at 20；Texas is in demand or loun at 7 ，
at low rates．

Tedngeday Evesing，Fehruary 1th．
There has beee conssiderabto activily in stoeks，to－day，and a largo num－ ber of trausfers bave been made ；but detalls are nut given．

Themasdi Evining，February 12th．
Stocks，to－day，were less netivo than tor severnh day y provious，probbbly
owing to the surnu which raged throughout the day．Few sules weru nusde
 panics bave consoldated their claims，and gled urticles of incorporation uu－ der the name of Bulliou sfiniog Company．Ten feot of this stook sold so－ day at rates unt dusired to be mado public．
There is some enquiry for Zouave；also for Oriental，at low rates，Toxss is in demaudat iow rates： 95 feet nold at $\$ 2$ ．Ten feet of Pride of Washoe sold at $15 ; 5$ feot of Sacrumento for 65 ．Accounts frum this mine are very favorablo for the suceess of the Company．Huzel Green has demand at tow Agures；Birdsall le quiet at 20；Allou Guds buyera at 45；Saota Foo is ofler－ ed at 12\％；Ural is attracting some notice，although no direct bids are made． Sinaloa is offered at $7 \%$ ；tou feet of Dunu sold at $6 \%$

Friday Ekzalivg，Fobraary 18th．
Thesky is again cloadless and the stock trade has shown unvonted ani－ mation today．Our brukers aro largely supplifed with San Francheo orders，many of which are being filled with considerable dificulty．Every－ thing bespeaks extruordiuary activity iu stocks the coming spring and sum mer．Alten is arvancing in favor rapidly，and is io deraand at 860 ；seller aro scarce however at these fecures．Sierra Nevhila is also in request at San Francinco quotations．Bulhon stock is enquirod for at $\$ 20$ per share，but there is little in the market．Texas atill in the market at low figures－$\$ 2$（a） 3．Five inoking ore is shown from the Pride of Washoe．This stock is stil held at $\$ 15$＠20．Burnslde in in market at $\$ 25$ ，and there is oomething of a disposition to deal in it at that price，but no aules aro roported．Milton is offered in emall lote at $\$ 100$ ，but a majority of the holders are awaiting higher bids．The aales reported to．day are， 15 feet of Allen at $\$ 60 ; 10$ fee Bullion at 21， 25 fect Oriental at 5； 10 feet Birdaall at 19\％／5； 30 feet Zouay at 6\％12，and in large demand at that figure．

## Saturday Eveming，February 14th．

The business of the week bas been large，and ahows a decided improve． ment upon the transactions of the last．Stockn to the amount，probably of $\$ 50,000$ or $\$ 75,0 c 0$ have cbanged hands in this market during the past seven dayn，and the brokers are stijl largely supplied with natied orders． Tbe Texas Mining Company was incorporuted to－day，under the Territorial aws，and there ie some activity in the stock； 45 shares sotd at from $\$ 3$ to $\$ 5$ ． There is still some inquiry for Zouave，at a alight advance on yesterday＇s guotations．No visible reason for this activity is discernable．The only sale reported is 20 feot at 750 ．
Yellow Jacket is held at $\$ 225$ ．Very foe ore is being taken from the dis－ puted ledge．Alion is fading buyers at $\$ 60$ ．Bullion is in request at $\$ 20$ ， with Ittle offering．The Oriental is meełfing with purchasers at $\$ 4 @ 85$ ten feat sold at $\$ 5$.

Honday Evening，February 16.
The week opens with a lively demand for atocts，and a large number of transfers have been made to day．Burnside has been the subject of somo excitement，and the market for this stock，whieh nepeaed at $\$ 25$ in the mor niog，reached 75 at 2 o＇clock，then receded a shade，until 6．The cruse o this sudden animation was the exhibition of seme very fow location on Amer claim．Somedine looking ore is fromg shown from a shaw shaft sumk upon a lodge to－ ward which a number of tunnela have been directed for two or three yeirs past．Zouave is in demand from $\$ 9$＠ 10 ，and littte has been offered at those figures．The tendency of this stock is decidedly upward．San Fraucisco cap－ ital is scelsing investment in it to something of an extent．Bullion Bad ready sale at 325 ；Yellow Jacket at $\$ 175$ to 200；Texas at 9；La Crose at 18 （a）29．Ten feet Yellow Jocket sold，to－day at $\$ 200$ ；ten of Thion at $15 ; 40$ or Zouave at 8 ＠10； 100 feot（probably）Buruside at from 27 3í＠（a） $75 ; 15 \mathrm{La}$ Cross at 20.

## From our Edition of Fcb 16th

## MINING EDUCATION.

In our last issue we referred to some of the disadrantages under which the California miners, as a class, labored by reason of the lack of a proper Mining Education. We also adverted to the fact that the popular autipathy against the application of science to mining, which was so prevalent amoog California miners, six or eight years since, has lately been pretty much laid aside. It is now very generally conceded that an empirical knowledge of mining is not the way to succeed in that difficult and uncertain branch of industry. The occurrences connected with the discovery and development of our silver and copper mines have produced such a change in public sentiment that, at the present day, it is rare to find a man who will openly avow, even if be secretly entertains, a belief in a necessary antagonism between theory and practice. Practice and science have now joined hands in the mines, and the time bas passed when the former will venture "to go it blind" in the vain confidence of shallow empiricism, anaided by science.

The attainment of a passable mining education, when proper facilties and-instructors are at hand, is not a work of so muich time and study as many suppose. The difficulties and mysteries involved in becowing an expert in planning and working a mine, and in acquining a practical knowledge of their geological and mineralogical characteristics, are no greater thian are to be ret with in many other subjects in the usual programme of practical and theoretic education. Experience is the foundation of success in all human under takings ; but the only value of experience is the facility which it affords us to deduce from previous results, a knowledge by which to overcome new or greater difficulties. This is identical with the inductive process of the man of science. But he that confines himself to his own limited experience, shuts his eyes against the lights of science; and, in despising the experience of others, he will soan find himself burried in the darkness of empiricism, while those who have entrusted him with their business will surely behold their undertakings enveloped in a labarinth of difficulties, which must sooner or later result in common and promiscuous ruin.

A large mine is a complicated machine, and we might with quite as much propriety place a ploughman, with no mechanical experience, whatever, in charge of a double cyl. ender printing press, as to place a man, whose experience in mining is confined to what he has done himself, in charge of a mining operation of any magnitude. The art of mining involves a general knowledge of mechanics, surveying, mineralogy and geology. To understand working a mine-boring, sinking, pumping, winding, stopeing, hauling and ventilation a tolerably correct knowledge of every leading principle in mechanics is needed. Without such knowledge the miner will find it impossible to decide upon the most economical means and arrangements for transport either in the mine or on the surface, the kind and capacity of engines needed, or the character and class of machinery best calculated to perform the work before him. Laying out the work propererly, each part with reference to another, requires a knowledge of surveying. To ascertain the proper place to sink shafts, involving calculations of the dip and strike of strata, probability of water, faults, \&c:, implies a knowledge of geology. : while by the aid of mineralogy only, can he determine the nature and valne of the minerals upon which he is working, or which may chance to come in his way. On a correct conclusion with regard to each and all these points depends the success of the undertaking. The employment of experienced men with liberal salaries, to superintend works of this description may sufely be predicted as uniformly resulting in larger dividends to stockholders, and increased safety to mine and workmen. Experience, coupled with a proper applioation of acience, is the obly foundation of fitness for the position of Mining Superintendent. The lack of these requisites has cost English adpentarers millions of pounds sterling-sometimes in the faulty opening of a mine, at others in the lack of mineralogical knowledge for determining the value and character of the mineral when found. We gave several instances of the latter in our last issue, we might multiply instances of the former adinfinitum.
It is to the lack of this latter information that we must atribute the delay in the developnient of the silver and cop. per mines of the State, a full dccade beyond the time when
their existence should have been known as the result of actual explorations.

There is but one way to remedy the evils here passed in review and provide our State with a competent corps of mining engineers and superintendents-A School of Mines must be established under the patronage and partial control of the State. An institution of this kind is absolutely pecessury to a proper development of: our resources. We need it as a collector and conservator of mining knowledge past and progressive. We need it as an institution for the general diffusion of information in this brabeh of industrial science. We need it as a place where the working miner, the proprietor and the engineer may be drilled and schooled in the art of mining; in all its bearings. Such schools have long beew in existence in nearly every country in Enrope where they are fostered with the greatest care by the different governments. We shall endanger our reputation as a progressive people if we much longer delay $a$ movement in this direction. The losses of property and misdirected outlay of capital already scored up, (to say nothing of the sad loss of life,) and laid at the door of inexperience, would have liberally endowed half a score of such schools.
Oar State Geologist, in his address before the Legislature two years ago, advised the early establishment of such a school. We have now a Legislative Committee on Mining. Is there any more important matter which can come before them than that which we are now disenssing? Have they ever thought seriously aponit? If so, or if not, heretofore, why would it not be well, at the present time, to prepare the general outlines of a plan forsuch an iustitution and let it go before the people, with a legislative endorsement, for future consideration.
Legislators are quite too prone to think that when they have enacted laws for the cr:ation and collection of revenue for the collection of debts and the pnnishment of crime, and, perchance, performed the herculean task of electing a United States Senator, they have fully discharged their legislative duties. They forget that thereare other equally, if not more important duties to perform, in providing the means for properly educating the adult industrial class of society. This is universally done in Europe, at least to an extent sufficient to proride compatent direotors for all the great industrial interests of the land.. We lave neither time nor space to say more under this hend than what will be merely suggestive; but we hold that it is quite time our Legislators should take this matter under consideration, and initiate some steps toward an ultimate accomplistiment of the end in view: The present "let alone" policy must iner. itably continue to result in serious losses, both to individu, als and the State, and we shall be fortunate indeed. if our chief industry is not thereby soon completely burried in the darkness of that empiricism in which it is already so sadly floundering.

## From oua Edition of Feb. 16th.

MINING INCORPORATIONS,
Nolwithstanding the attempts at editorial pleasantry that are so frequently indulged in by our contemporaries, at the lengthening list of mining Companies, and the cumulative exhibits, of the many millions of capital which they represent, "ol paper," each passing month bringe additional evi. dence that this wealth is far from imaginary. The constant ly increasing values of the figures which appear in our weekly stock reports, appended to the leading mines on the East ern Slope, are stubborn facts, which must soon make plain to the most anbelieving that the footings of the aggregate "capital," placed as a value upon the mines now in progress of development, are not much too high. Imagination can scarcely form any adequate cenception of the minera wealth, which is soon to be developed on the Eastern Slope, and throughout the entire length and breadth of the "Great Basin," whose Western and Eastern rims are formed by the rocky slepes of the Sierra Nevada and Rocky Mountains.
Several of these earliest formed Compauies, which, in the estimation of the great mass of people at that time, fixed their capital stock at an almost fabulous figure, have already reached the immediate vicinty of their incorporate value and their stock will no doubt, ere long, be quoted at a handsome percentage "above par." Indeed, one of them has already exceeded its par value and is quoted to day at more than 60 per cent. adrance.

Numerous others, second and third class mines, are making such favorable developments, at the present time, as give good earnest of an early approximation of their stock to par value.
A few years since scarcely a merchant in San Francisco could be induced to invest a dollar in any mining enterpriso. To do so was to lose caste, and endinger one,s credit "on change." Even vur foundrymen, could not be induced to invest a dallar, in a business to which they were then, as now indebted for alinost their entire business. Now things are entirely changed, and one can scarcely find a mau in San Trancisco who does not own "feet" in some mining claim, What matter is it if a large portion of these projected, companies should fail? All; or even a majority cannot hope to succeed. A sufficient number, however, will prove so remunerative as to return a handsome aggregate percentage on all the money invested. Hitherto the chief burden and losses attendant upon opening up the mines of California, have fallen upon the mining community almost exclusively, while the commercial and agricultural interests have been greatly profited at no risk. It is one of the conditions of mining, everywhere, that many individual losses, must occur, which, however, are always made good in the general aggregate of profits ; and it is creditable to the mer cantile interest of this city that it has now taken hold of the matter of developing the mines of the State and is freely pouring out its capital for that purpose. The aggregate of these investments cannot fail to be highly remunerative, and will reward the loosers even, in the increased business which they will create and concentrate in San Francisco. This city owes its very existeuce to the mines, and it betrays a feeling of selfishness in any man of means, to refuse to do his part in developing the interest upon which its prosperity depends. Every new Mining Company, whose organization is announced, is evidence that a new mine has been dis covered, and that somebody intends to spend a little money for its development. Every such item is a matter of encouragement, and iodicative that the great interest of the State is progressing. We trust the day is tar distsnt when we shall fail to find in each morning's paper the annoucement that some new mining organization has been effected during the previous day.

## SUGGESTIUNS ABOUT FOREIGN PATENTS.

American inventors should bear in mind that, as a general rule, any invention which is valuable to the patentee in this country, is worth equally as much in England and some other foreign countries. Four patents-A merican, Englisb, French and Belgian-will secure an inventor exclusire monoply to his discovery among one hundred millions of the most intelligent people in the world.
The facilities of business and steam communication are suct, that patents can be obtained abroad almost as easy as at home. The majority of all patents taken out by Ameri cans in foreign countries are obtained through the Mining and Scientific Press Patent Agency. Having established agencies at all the principal European seats of Government, we obtain patents in Great Britain, France, Belgium, Prussia, Austria, Spain, etc., with promptness and dispatch.
Models are not required in any European country, bat the atmost cars and experience is necessary in the preparation of the specifications and drawingse
When parties intend to tak out foreign patents, engravings should not be published antil the foreign applications Cave been made.
Caution.- It bas becoune a somewbat common practice for agents located in Eugland to send out circulars soliciting the patronage of American inventors. We caution the latter against hecding such applications as they may otherwise fall into the hands of irresponsible parties, and thas be defraaded of their rights. It is much better for inventors to entrust their
bome.
Whil
While it is true of Most European countries that the rystem of examination is notso rigid as that practiced in this country, yet it is vastly important that inventors should bave their papers prepared only by the most competent solicitors, a order that they may stand the test of a searching legal ex amination ; as it is a common practice when a patentee finds a purchuser for bis invention, for the latter to cause such examination to be made before he will except the title.

It is also very unsafe to intrust a valuable invention to any other than a solicitor of known integrity and ability. Inventors should beware of speculators, whether in the guise of patent ageits or pateot brokers, as they cannot ordinarily be trusted with valuable inventions.

## WHEELER'S

 Amalgamating and Separating PansIt is acknowledged by all who have exan ined the prinsiples and witnessed the operation of these Pans, tha they are decidedly superiur for triturating and amalgamating purposes to any other in use.

The monst important principle connected with the one ration of these Pans is the seperation of the triturativg procoss from thrt of exuracting the amalgam from the
gaud. The chier cause of luss of che precious metials arisaud. The chier cause of luss of che precious metals uri-
ses from the passing off of the samo in combiuation with ses from the passing off of the samo in cimbian aick in the quicksilver, during the pruces of trituration, apu in
cleaning up. By the introduction of the Separating Pan to f. llow the trituration this loss is entirely aynided. In Working these machines there is no appreciable loss of quicksilver, und henco none of the precious metals.
Where these Pans have been int odnced and operated by the sidio of others ou sands from the same vat, the
Wheeler Paus have uuiformly gaiued a large percentage of metals over its competitor s , BS well as a still larger percentage in the amount of work performed.
***These Pans man be seen in daily operation, at the Miner's Foundry, on First street in this city, where all interested are invited to call and examine for themselves. Dol6-tf

In view of the immense amount of Aathracito Coal now annually consumed, the product of the mines of the United States, it is difficult to relize that its utility as an article of fuel was comparatively of so recent discovery. Prior to about 1822, it was known only in Penusylvania as an in cumbrance to the ground, a "black rock," not even fit for , building purposes. Governor Findlay is said to have discov ered its inflammability by accident, having heaped some of
the "stones" on his fire to ascertain whether they contained any metalic substance. But a great many experiments were tried befure it became usefulas a colorific agent. An old Quaker is said to have been the frit one who originated the plan of buruing it in opep grates.
The product of Anthracite coals is confined almost exclusively to Penusylvania. The crals of England are bituminoa, $s^{\prime}$ and were used for fuel to a limited extent by the Danes and Saxons, many centuries ago. As long ago as 1306 , the use of coal was prohibited in London under the supposition that it was dangerous to health, and, indeed, as far back as 1281, coal was an article of trade at Newcastle, Eng.

Copper in Nevada County.-The Zinc House Copper Mines, on the Auburn Road, about which the Nevada Co. papers have had much to say, lately, appear to be progressing finely. From a private letter received yesterday, we are permitted to make the following extracts:
"The Pennsylvania Co. have struck their ledge at 27 feet and the assay of their ore at that depth was $18 \frac{1}{2}$ per cent. -every body elated and no one offering to sell. The first North Extension-"The Exchange Co." are preparing to get to work, in earnest, as the ledge has been struck both sides of them, making it a 'sure thing' that the lead runs through their ground."
A late number of the Grass Valley Notional, speaking of copper ores in that vicinity says:-"Copper miners who have worked in Europe, in Michigan and in other copper fields, assure us that they know of copper veins in the vicinity of Grass Valley, as also in proximity to Nevada, many of which will pay at least thirty per cent. The ore can be extracted at a light expense." The National further adds: "The copper mines of this section have one great advantage over thase of Lake Superior in this: At the latter place large masses of native copper, frequently weighing one hundred tons, are found, and the expense of extracting them is generally greater than the amount realized for the sale of copper. These immense blocks are chiseled out at an ex, pense of $\$ 10$ per foot, the work of course being done by hand. In all the copper ledges yet discovered in Nevada county, as we are informed by prospectors, the native copper found is in small particles, and of course is easily ex tracted, As the work of descending on copper lodes progresses, and great depths are attained, immense masses of native copper, like those found in the Michigan mines, may be found ; but by that period the price of labor will doubtless become reduced, and copper miners can afford to extract metal which at present, labor and transportation rates being high, would prove anything but remunerative."

The inventor of rebel torpedoes for blowing up vessels is a Massachusetts Yankee by the name of Ivins. He also built their ram Arkansas, the only crait that has troubled us on the Western waters. Sometimes they talk of forming a confederacy and leaving out New England; but even in their deviltry they have to look to Yankee genius. To leave New England out would be like a man's knocking off the top of his head to improve his intellect.

## TREATMENT OF SILVER ORES.

We commence, with the present issue, the republication, from the London Miving and Simelting Magazine, of a very interesting treatise on the Mexican method of amalgamating silver ores. This treatise is from the pen of a distinguished scientific man, who has a thorough practical as well as theoretic acquaintance with the subject upon which he writer. It will be continued through some five or six numbers of the Press, and will be found of much value to those of our readers engaged in mining for silver. Those who do not file the paper regularly, should at least preserve the numbers containing these articles. They will be fuund valuable both for relerence and study.

We have examined some very rich specimens of copper ore, at the office of Thos. Ogg Shaw, 422 Montgomery St. They were taken from the Keystone, Kentucky, Union and Webster ledges, Cupperopolis. Mr. Shaw has just returned trom the Copperopolis region, where he has been engaged in Superintending the putting up Mrs. Hall's Smelting Furnace and Condenser.

Some of the richest copper ore in the city may be seen at the office of the Miners' Foundry, on First St. It is from a mine recently opened near Lorello, Lower California, under the direction of R. McKee, Esq. We are promised some further facts with regard to this and other noines in that vicinity, which we shall place before our readers as soon as received.

Map of the Husboldt Mines.-We understand that a map of the Humboldt River Mines has recently been published in this city. Such a map, if full and correct, must be a valuable addition to our mining geography, at this time. We have not yet seen a copy.

The Geologicar. Survey.-The Sacramento correspondent of the Herald of Feb. 17th, says:-"The expenditures of the geological survey up to the present time has been $\$ 46,749$ 77. As the total amount appropriated for the Survey is fifty thausand dollars $(\$ 50,00$, ) it follows that only about three thousand and two hundred and fifty dollars $(\$ 3,250)$ remains available for prosecuting the work during the next six months ; and that unless some special provision is made by the Legislature it will bo stopped entirely in February or March."

Discovery of a Lead and Silfar Mine in Nevada Coun-TY-A mine containing lead and silver in large quanties, has recently been discovered in Washington township, about twenty miles above Nevada. A piece of the ore assayed by Mr. Ott, yielded 77 per cent. of lead, and silver at the rate of 140 ounces to the ton. The ledge is said to be 14 feet in thicknes, and to appearances the ore is of uniform thickness. [Nevada Democrat.

A Wide Ledge.-The Bacon Ledge, at Gold Hill, N. T., now owned by Fairfax, Doake \& Co., has proved itself, by recent explorations, to be eighty feet wide.

THE MEXICAN METHOD OF AMALGAMATION.

> BY JAMES NAPIER, JCNT, F. C.S.

Late Chiemist and Assayer to the Guanaxuato Slint, Mexico.

## introduction.

Before proceeding to describe in detail the Mexican metlood of amalgamating silver ores-which will principally apply to those which crme under my own observation at Guaoaxuato-I propose making a few introductory remarks on the history of the Pa io amalgamation process, and on the composition of the ores charasteristic of some of the different districts.
The ancients were well acquainted with the property which mercury has foreombining with gold and silver, and took advantage of the fact for romoving gold from old apparel by first burning them to ashes in an earthern pot and then amalgamating them. IIumboldt also states that, before the discovery of America, the Germans employed marcury to extract gold from auriferous sands as well as from irou and copper pyrites; but we have no knowledge of mercury having been enrployed for the purpose of extracting silyer from its ores before the year 1557, when Bartolome Medina, a miner of Pachuca, in the neighborhood or Rea del Monte, in Mexico, discovered the "Patio" niethod of amalgamation. It is very difficult to form any correct idea as to Thow this wonderful process was invented, und what it was that led to the discovery. It could nut have been by chemical reasoning that Medina mixed the various ingredi-ents-sulphate of copper, (magistral) salt and mercurywith the minerals of silver to extract the metal ; and the discovery appears most extroordiuary when we consider that the process requires weeks and even months for its comple tion, so that a long time bad to elapse before the result of an experiment could be obtained. We can only suppose that Medina, being awfare of the property which mercury bas of combining with silver and forming amalgam-and also knowing that anhydrous sulphate of copper (obtained by calcining copper pyrites) when immersed in water gives out heat-conceived that if these were mixed with silver ore and common salt (which was thought to have a cleaning effect on the silver previ us to its combining with the mercury), that the heat cansed by the sulphate of copper would favon the amalgamation. Although this process requires a long time for its completion, the operation of reduction commen ces almost at once, so that by taking out trials swon after the incorporation of the mass it could be seen that the mercury was taking up silver ; and it would be easy to know by burning at iutervals a weighed portion of the amalgam, how much silver the whole qauntity of mercury added would contain, and when the process was completed.

In 1586, a Peruvian miner of the name of Carlos Corso de Leca discovered what has been termed "el beneficio de hierro" (the reduction by irou.) This consisted in adding to the torth small pieces of metalic iron, the object of which was to save mercury, which it would do by reducing the chloride of silver; but I am not aware of this process ever having been worked to any extent.

The next improvement made was by Alonzo Barba, in ${ }^{7} 1590$. It consisted in amalgamation in large copper pans, heated from below, and was called "el beneficio de caso $y$ cocimiento." In this process there was a great saving of mercury, but a large consumption of copper, as the chloride of silver was rednced at the expense of the copper pans it answers very well for the native chlorides, but not for sulphides of siiver. In 1784, this process was introduced into Europe by Barou de Born, au Austrian mining officer, and from it has sprung the barrel amalgamation of Frieberg, proposed, I believe, by Gellert. So that from the process first invented by Madina, in Mexico, has sprung all others for amalgamating silver ores; and although bis original process hos undergoue many alterations, the principle still remains the same.
siliter ores of a fey of the districts of mexico.
I believe that every known ore of silver has been met with in some one or other of the numerous mineral districts of Mexico, but many districts have ores peculiar to themselves, and all ores will not yield their silver by the "patio" amalgamation.

Perhans the ores of Guanaxuato yield their silver by the patio analgamation better than those of other districts,
from the fact of their containing hut few foreign metals ; the tively htitle ore, formenly gave very large quantities of chlosilwer being mostly found in the form of pure sulplides, iu ride, bromide and iodide of silver. These were reduced to many instances in carbonate of lime and quartz veins. The a great extent by the "Caso process," or in copper pans. A following shows an analysis of ore from the district of "La large quatity of the ore from this district is also smeited in Luz," in Guanaxuato :-

| Silica. | 75.00 |
| :---: | :---: |
| Silver. | 1.04 |
| Iron. | 4.71 |
| Carbonate of | $\text { - } 8.25$ |
| Sulphar. . | 3.29 |
| Copper | . 55 |
|  | 99.60 |

This, however, is not to be considered by any means as an average sample of ore from this district, for the average richness of the ores produced here will probably not exceed from 45 to 60 onnces of silver fer ton. Nearly the whole of the ores of this locality contain gold in various proportions. To show what proportion the gold bears to the silver we sulijoin the coinage of the mint of Gumaxuato for ten years, commenciag at 1850 .

Coinage of the Guanaxuato Mint for 10 years.

| Year. | Gold $\$$ | Silver $\$$ | Total $\$$ | Ter Cent <br> of Gold. |
| :---: | :---: | :---: | :---: | :---: |
| I850 | 709,472 | $7,801,300$ | $8,510,772$ | 8,336 |
| 1951 | 606,022 | $7,011,750$ | $7,617,772$ | 7.955 |
| 1852 | 746,956 | $7,625,650$ | $8,372,606$ | 8.921 |
| 1853 | 723,088 | $6,235,922$ | $6,969,000$ | 10.375 |
| 1854 | 450,288 | $5,029,712$ | $5,480,000$ | 8.216 |
| 1855 | 555,200 | $4,698,800$ | $5,254,000$ | 10.567 |
| 1856 | 479,476 | $4,306,524$ | $4,786,000$ | 10.018 |
| 1857 | 571,700 | $4,747,300$ | $5,318,000$ | 10.731 |
| 1858 | 489,744 | $4,725,256$ | $5,215,000$ | 9.391 |
| 1859 | $438,8^{\circ} 0$ | $5,046,120$ | $5,485,000$ | 8.001 |

The ores of Zacatecas frequently contain argentilerous blende, which makes them rather more difficult to work than those of Guannaxuato. Gold was almost unknown in the mines of Zacatecas until 1856, when a vein was cut in the miue of the "Bote" coutaining large quantities of gold, which still continues to yield a considerable produce of that metal.
Real del Monte produces ores of a very various nature, some containing considerable quantities of maganese ; as the following analysis of a sample by Mr. Rogers, from Santa Brigida vein in that district, will show :-

My late lamented friend Mr. Edward Louckner, who has examined these and similar ores very carefully, states that the silver in many cases exists as a manganate. The ore from the various mines of this locality differ very much in their nature and compo-ition, and have co nsequently to be reduced by different methods: some are reduced by patio, others by barrel amalgamation, and some are smelted, Some of the silver produced here contains sufficient gold to make its extraction a matter of importance.
In the district of Angangueo the silver exists mostly combined with bl-nde avd sulphide of lead, and is reduced by smelting. The following analysis shows its composition :

In Fresnillo the ores worked do no not perhaps exceed rom 16 to 24 ounces of silver per ton, but the quantity opcrated upou is very large indeed, being about six thousand cargas (A carga is equal to 3001 lbs ) weekly : the grinding is partly carried on by steam power. There is but one reduction works in this locality, but it is the largest of its kind in the world. The ores contain no gold.
The district of Catorce, although now yiolding compara-
small blast furnaces. The ores contain no gold.
In the district of Reyes the ores differ very much in composition, as may be seen from the followiog analyses :-

Some of the antimony in the second analysis existed as red sulphur. The first analysis may be taken as an average of the ores worked in this locality, although very trequently antimony is also found in various proportions. By the $P$ atio amalgamation not more than from one half to three. quarters of the silver can be obtained from these ores, and this only with a large loss of mercury. In examining various samples from this district, we have found part of the silver to exist in the form of silicate, which it is difficult to separate except by smelting; and the ores in general are not sufficiently rich to admit of this process being adopted where charcoal is so very expensive and scarce.

In the district of Jalpu a very interesting mineral of sil ver lias been found, which, according to R. Riclter, has the following composition:-

Affording the formula ( $3 / 4 \mathrm{Ag}$ plus $1 / 2 \mathrm{Cu}$ )S. It has a leadgray colour, and is malleable like ordinary silver-glance. Cleavage monometric, specific 6.877 to 6.890. Broithaupt has given it the name of Jalpaite. (American Journal of Science, 2 ser., vol. xxvi. p. 358. )
In many of the mineral districts of Mexico there are thon-1 sands of tons of low-class ores which would not pay the cost of amalgamation. Various plans and apparatus have beeri proposed from time to time for concentrating these ly washing, but up to the present time we know of none which has proved effective. Some of the machines have exhibited, much skill on the part of the inventors, and for many classes of ores I have no doubt they might answer admirably. To concentrate these ores they would first have to be finely. ground, because the sulphide of silver. is very intimately mixed witl the gangue, and this operation is a very. expertsive one in Mexico, having to be done by animal power. Besides, in grinding, the sulphide being softer than the gangue, becomes so fine that the portion which passes away in the water used for washing contains in many instances as much; and sometimes more, silver than the portion remaining behiad:
It may not be out of place just to remark here, that ber sides its wealth in silver, Mexico is much richer than is generally supposed to be the case in other minerals. In the present condition of the country these are of cour e quite inavailable; but they present the elements of great future prosperity when law and order are restored, and proper secu rity given to induce the application of the necessary capita to make them available. Many of these ores are distine tive in their composition, and are little known in Europe. [ To be coutinued.]
Old Iron.-The shipping of old iron from San Francisco th to the East is becoming quite a business, and begins to attrac atteution. Old iron is bought up in San Fraucisco at teu an twelve dollars per ton. After going East and being wrough over, the same iron is reshipped to San Francisco and sol. or $\$ 80$ and $\$ 110 \mathrm{pr}$ ton. The Bulletin urges the establis ment of a rolling mill in San Fraucisco to work up old iro and thereby stop such an unequal traffic as that of selling fo ten and twelve dollars per ton, and then buyiug it back a $\$ 80$ and $\$ 110$.

## MINING AND SCIENTIFIC PRESS.

## SAN FRANCISCO MINING NOTICES.

## assessments letimd.

Texas Co., at a Mer ting held Feb, 14, lovied an assessmont of un! dullar per olares payable to the sucretary in Virginin C'ity.
Sunta Rusa Co.-February assessment of 20 cents per thare now due and payable.
Madison Co.-An ansessment, two dullars per share, was lavied Ferb. 17, payable immedrately, at Offies, G00 Mer chant St.

Tuiun Co.-An assessment of one dullar per slare was levied Feesruary 16, payable on or before Mareh 25.
Penn Co.-An assebsment of \&3 per share was lovied Felb. 5, one half payable Murch 1, buhance April 15.
Kossuth Co., Devil's Gate District.-Au assessment of 10 ets. per share was levied feb. T.
Cunstitution Company levied an assessment of 25 cts. per הeb. 11, payuble immediately.

La Pluta Uro Co. lovied an assessment of five doltare per thare, Feb. 9 , payable at Ollice of the secretary in Virginia City
Lat Plata Co. lovied an assesment of 50 cts . per share Peb. 2nd, payable at Olfice of the P'resideut.
Alamo Co. levied an assessment of 50 cts . per share, Feb. 1, payable on or before March 20, at 115 Cul. Strect San rancisco, or at office in C'arson City.
Tucker Cu. levied an assessment of 25 ets. per share, Feb. 11, payable immediately at 608 Merchant st.
Hawley Co. levied an assessment of one dollar per share, n Feh. \%, payable on or before March 12, to Superinteadout at the mine, or Secretary at Office.
Shute Rangy Co. levied an assessment of 50 ets. per share, Peb. 4, payuble, March 15.
Assessments upon Mining Stock have been levied as fol-
Caledonia G. \& S. M. Co. levied an assessment, Feb. 1 of su cents per share, payable immediately. Sale ol deliquent stock will be made Murch Tth.
Moss G. \& S. M. Co.-Anassessment of 50 cents per share was levied Jan. 27, payable at 428, Moutgomery St., or to the superintendent al the mine.
White Cloud G. \& S. M. Co. levied an assessment of 25 cento per share, Jan. 27, payable to the Secretary, at 128, Montgomery s't.

Warren $G, \& 5$. Mining Co.-An assessment of 75 cts . share was levied Jan. 26, payable to the Supt., at Vingina City, or to the Sec., 428, Montgomery St.
Warren G. \& S. M. Co.-An assessment of 50 cents per share was levied Jrn. 27, payable to the Sec. in this city or to the supt. at the mine.
El Dorado G. \& S. M. Co,-An assessment of One Dollar per share was levied Jan. 23, payable to the Nee. or to the Supt.

Grudaloupe S. M. Co.-An assessment af $\$ 30$ per share was levied, payablo on or before March 1st.
El Tesora Mining Co.-An assessment of $\$ 1 \frac{1}{2}$ was levied Jaa. 27, payable at office on or beforə Feb. 27.
Polar Star G. \& S. M. Co. levied an assessment f 50 ceuts per share, February 4th, payable on r before the 4th of March, at the Uffice in this city or
o the Superintendent at the mine in Aurora, (Esmeralda.)
Dios Padre G. \& S. M. Co. leried an assessment of 3 dollars per share, Jan. 31, payable in 30 days, alsu an assessment of 2 dollars per share, payable in 60 days, at office 502 Montgomery street.

Beckwith G. \& S. Mining Co.-An assessment of 25 cents per share was levied Jan. 24, payable immediately.
Sonora Mining Co,-An assessment of 25 cents per share was levied,Jan 23, payable imnediately.
Overman Mining Co -25 eents per foot, Jan. 29, payable within ten days.

Chs. Caney Mining Co.-50 cents per share, Jan. 21, payable ou or before Feb. 20th.
Aaliatic.-Fifty cents per share, payable at No. 4. Armory Hall, San Francisco, or to the Superiatendent at the Mine. Hattie G. \& S. M. Co.-Thirty eents per share, levied Jan. 31, payable at Office in San Francisco, or at the Mine.
Hrale \& Norcsoss-Assessment of Ten Dollars per
Share, levied Jan. 31 - payable at the Office in this city, or Share, levied Jan. 31 -payable at the Office in this city, or to John Skae, at the Mine, on or before Feb. 25.

Nierra S. M. Co. An Assessment ofs $21 / 2$ was levied Jan. 22 -payable immediately, at Office 575 Mission St.
Mount Davidson Co.-An Assessment of 50 cents per Share was levied, Jan. 23, payable on or before March ist at Office 47 Montgomery Block.

Mina I'rieta is. M. Co. - An Assessment of Five Ihuilars per share was levied. Jan. 31. payable on or bure March th-at Ollice, cor. Montgomery it Jacksun Sts.

Recorder Mining ( $0 .-$ An Assessment of One Nollar ner oot was levied Jan. 19, fayable hatf on or betore Feb. 18 and balance on or Lefure March 20.
Ifule \& Norcruss N. M. Co. have levied an absessment of sis per ahare payable on or before Jan. 26 th.
Marlin White.- An assesement of 20 ets. a share was levied, Jan. 2.
Oriental G. \& S. M. Co.-An assessment of 50 cte. per share was levied, Jan. 14. payable at Uffice, cor. Sutton Aventu and C'St., Virginia City.
Baltimore America Consolidated. An assessment of 50 ents per share was leviel, Jan. 5.
Sayage.-Au assesstuent of $\$ 35$ cents per share was levd, Jan. 7.
Hawley.-An assessment of 25 cts . per share was levied Jau. 5, payable in 30 days.
Cole S. M. Co.-An assessment of One Dollar per share was leviod, Juu. 10, payable, Feb. 1.
United States M. Co.-An assessment of six and twothirds ets. per share was levied Jan. 10, 1863, payable to the Superintendent at the mine, or to the Secretary, lioums 7 and 8 , Government House, Sian Francisco.
Sierra Nevada S. M. Co. levied an assessment of $\$ 15$ per share, Jull. $1 \overline{1}$-payable Feb. 18.
Lady Bryan.-An assessment of 70 cts . was levied, Jan. 3, payable on or before Feb. 16.
Ida. G. \&\& S. Co. (Russ Distriet)-An assessment of $\$ 1$ vas levied, Jan. 14.
Red, Wuire and Biue G. \& S. M. Co. levied an assessment of 25 c -nts per share, payable on or before ${ }^{\circ}$ Feb. 1st ffice cor. Pine and Montgomery Sts.
Mina Prieta S. M. Co.-An assessment of $\$ 10$ per slare was levied, Dec. 26, 1862-payable at office, cor. Montgomory and Jackson Sts., on or before Jan. 26, 1863.

## company meetings.

The Cocheco Co. will hold a meeting at No. 606 Montgomery St., on Monday, March 2nd, for the purpose of re vising By-Laws, etc.
Ohs. Caney Co.-Special meeting of stnckholders will be held on Wednesday, March 18, to consiaer the propriety of an increase of capital stock.
South Utah Co. will hold its annual meeting for election ef Trustees, etc., at No. 608 Merchant St., March 20.
Nevada Co. will hold its annual meeting for electing Trustees, etc., at 608 Merchant St., March 20.
Potosi Co.-Annual meeting will be held at Office, in this city, March 3d.
Aunie Lauric Co. will hold its annual meeting for election of Trustees, etc., March 19.
Santa Rosa will hold its annual meeting, March 5, at Tucker's Hall.
Desert Co. will hold its annual meeting, March 4.
Daney Co. will held its annual meeting, March 2.

## ASSESSMENT SALES.

Texas Co. will sell delinquent shares, on the 14 of March.
Meredith Co. will sell delinquent stock, March 2 n .
Coso Oo. will sell delinquent stock, March 18.
Moray Co. ( $\overline{\text { V }}$. City.-Suits for delinquent assessments will be commenced, March 14.
Michigan Co. (Gold Hill) will commence suits for delinqueut assessments, March 16.
Sales of Stock for non-payment of assessments are advertised to bo sold as follows :-
North Potosi Mining Co.-Sales deliquent stock will be made March 17.
Peytona G. \& S. Mining Co.-Sales of delinquent stock will be made March 1st.
Cole Silver Mining Co.-Sales by Jerome Rice \& Co., 327, Montgomery St., San Fraucisco, on the 25 th of February.

Combination G. \& S. Mining Co.-Sale by E. S. Spear \& Co., at 433 California St., on the 10th day of March next.
Lady Bryan G. \& S. M. Co.-Shares of delinquent stockholders will be sold at auction for assersments, at No. 400, Montgomery steet, on Jan. 27.
Desert Mining Co.-Shares of delinquent stockholders will be sold nt anction, for assessur, nats, at No. 400, Mout-
gomery street, Jan. 27.

## Gl:MEIBLL Nutices.

Jenny Lind (Fismeralida.)--()wners of around in this Co. are rergiestes to call and sign deed of thmot at 608 Merchant St.

Monut Irone ('o.- Cersuns cloiming stock are reçrested to present title papers for exumination till March 16.
U. S. Mininr ('o.-All prersons claming stuck are requested to present fitlo papurs for examination at Nos. 7 \& 8 Govermment House.

Caution.-D. M. Tyrell wams persons against purchasifig a certain 10 feet of promel in the Wellingtum ('o., standing in the mame of J. J. Maree-also 20 feret, standing in name of W. Williams. (See Territurial ksterprise.)

Ashland Co.-I. A. Gould, in the name of the Moss Co. notifies the Ashlnnd Co. that their westerly drift has cut the Lambledre, in the Moss C'o.'sqround, from which the Aslo laud Co. is forbidden to extract any valuable metals.
Coso Silver Mining Co.-The Office of this Company hoe been remored from the Sterenson House to Nos. 11 and 13 Court Block, No. 636 Clay street between Muntgomery and Kearny. Entrance on buth Clay and Mevehant streets.

Fenry Martin G. \& S. M. Co.-"Mhomas Wallace, Trustee." gives notice that whereas certain parties illegally clajming' to be 'rrustees of this Company, have clanged the name of the Corporation to the North Star G. \& \&. M. Cu., and illegally elected uficers for the same, the public are cautioned against such acts, etc.
The Swieney Co., Gold Hill, give notice that Baltie Company have wrongfuly claimed and worked their ground since July, 1860.
The Cumaney Rock Co., lying next west of the Virginia Co. claims have notified the Hazel Green, Tingley and Buach \& Paxton Companys that they are tresspassing upon the Chimney Rock Co's ground.

## ESMERALDA MINING NOTICES.

The Zenobia Lode Company, give notice that they claim a superior title to the Jolusou Co., claiming the same ground, so far as said localities couflict. This ground is a portion of that now held by the Company known as the Wide West Company. The notice is signed by A. Waddell, J. C. Dorsey. S. P. Dorsey and James Elder,

## MINING AND SCIENTIFLO PRESS.

THE ONLY MINING, MECIIANICL AND SCIENTLFIC PAPER ON THIS CONTINENT.

## THIRD KEAR: VOLUME MI.-NEW SERIES।

A new volume of this extensively circulated paper commenced Scpt. 11, 1862. It is intended that every number shal bo replete with information
concerning Mining, scientific, Mucluanical and Industrial pursuits, together with several original engraviags, of auw inventious, etc., prepared expressly for its columus.
This puper is devoted to the above purposes, together with the interests of seicnce, Arts, Agriculture add Commerce, and any general information
that may be of interest to the roader ; nus it is the intention of the propriotor to spare no puins or expense in muking it equal in interest and valuablo information to any puper yet published.

## The Mining Interest!

Will find it of grrat value, as it will contain all the news anpertaining to Miniug, the prwes and sules of Mining stocks, new inveutions of Muchinery addeper to hat parpose, and of everythms gencrany tain may be of service
to tho

## The Inventor !

Will find it an excellent meduin for the purposis of bringing his invention
 in obtaining his patert, the preprictor haviag had great experience as a Patent Agent, tngether with faciltius at Washington that crable him to ob ain Patents with dispateh.

## The Mechanic and Manufacturer!

Will bo greatly bonefted by its perusal, as each numbor will contan several nriginal engravings of new machimes and inventions, logethor with a large arnoust of reating matter uppertainmg thereto. We are constantly receiving the best scicutific lourbals fonm all quarters, from which we shall cont
readers.

To Chemists, Architects, Millwrights and Farmers! This journal will be iuvaluable. All new discoreries in Chemistry will be Hillwrights will be fuanil in cur columis. Tho Farmersand planters will got bo neglecterl, engravings will be given of hgricultural inplements, aud the farming iutercst generally will beamply discussed.

## Texms.

## [Froan tree Loxdon "Mining and Sulling Magazine."]

THE MEXICAN METHOD OF ANALGANTATION.
by James Napise, JEN., F. C.S.
Late CHemist nad Assajer to the Guanaxunto Mint, Mexico.

## introduction.

Before proceeding to destribe in detail the Mexican method of amalgamating silver ores-which will principally apply to those which came under my own observation at Guaoaxuato-I proposie making a few introductory remarks on the history of the Pa io anlulgamation process, and on the composition of the ores charasteristic of some of the different districts.
The ancients wore well requainted with the property which mercury bas for combiniug with gold and silver, and took advantage of the fact for renowing gold from old apparel by first burning them to nshes in an earthern pot and then amalgamating them. Humboldt also states that, before the discovery of Ainerica, the Germans employed mercury to extract gold from auriferous sandes as well as from iron and copper pyrites; but we have ne knowledge of mercury having been eniployed for the purpose of extracting silver from its ores before the year 1557, when Bartolome Medina, a miner uf Frachuca, in the neighborhood or Real del Monte, in Mexico, dissovered the "Patio" method of amalgamation. It is very difficult to form any correct idea as to how this wonderful process was invented, and what it was that led to the discovery. It could not have been by chemical reasoning that Medina mixed the various ingredi-ents-sulphate of copper, (raagistral) salt and mercurywith the minerals of silver to extract the metal ; and the discovery appears most extraordinary when we consider that the process recquires weeks and even months for its completion, so that a long time had to elapse before the result of an experiment could be obtained. We can only suppose that Medina, bsing aware of the property which mercury has of combining with silver and forming amalgam-and also knowing that anhydrous sulphate of copper (obtained by calcining copper pyrites) when immersed in water gives out heat-conceived that if these were mixed with silver ore and common salt (which was thought to have a cleaning effect on the silver previ us to its combining with the mercury), that the heat caused by the sulphate of copper would favour the amalgamation. Although this process requires a long time for its completion, the operation of reduction commences almost at once, so that by taking out trials suon after the iucorporation of the mass it could be seen that the mercury was taking up silver ; and it would be easy to know, by burning at intervals a weighed portion of the amalgam, how much silver the whole qauutity of mercury added would contain, and when the process was completed.
In 1586, a Peruviau miuer of the name of Carlos Corso de Leca discovered what has been termed "el beneficio de Jierro" (the reduction by irou.) This consisted in adding to the torta small pieces of metalic iron, the object of which .was to save mercury, which it would do by reducing the chloride of silver ; but I am not aware of this process ever. having been worked to any extent.
The next improvement made was by Alonzo Barba, in 1590. It consisted in amalgamation in large copper pans, heated from below, and was called "el beneficio de caso y cocimiento." In this process there was a great saving of mercury, but a large consumption of copper, as the chloride of silver was reduced at the expense of the copper pans it answers very, well for the native chlorides, but not for sulphides of silver, In 1784, this process was introduced into Europe by Baron de Born, an Austrian mining officer, and from it has sprung the barrel amalgamation of Frieberg, proposed, I believe, by Gellert. So that from the process firist invented by Madina, in Mexico, has sprung all others for amalgamating silver ores; and although his original process lias undergoue many alterations, the principle still remains the same.
silver ores of a few of the districts of mexico.
I believe that every known ore of silver has been met with in some one or other of the numerous mineral districts of Mexico, but many districts have ores peculiar to thenselves, and all ores will not yield their silver by the "patio" amalgamation.
Perhaps the ores of Guanaxuato yield their silver by the patio analgamation better than those of other districts,
frim the fact of their containing hut few foreign metals ; the |tively little ore, formerly gave very large quantities of chlosilver beiag mostly found in the form of pure sulplides, iu ride, bromide and iodide of silver. : These were reduced to many instances in carbonate of lime and quartz veins. The a great extent by the "Caso process," or in copper pans. A following shows an analysis of ore from the district of "La large quautity of the ore from this district is also smelted in Laz," in Guanazuato :-

This, however, is not to be considered by any means as an average sample of ore from this district, for the average richness of the ores produced here will probably not exceed from 45 to 60 ounces of silver per ton. Nearly the whole of the ores of this locality contain gold in parious proportions. To show what proportion the gold bears to the silver, we subjoin the coinage of the mint of Guanaxuato for ten years, commeacing at 1850.

Coinage of the Guanaxuafo Mint for 10 years.

| Year. | Gold \$ | Silver \$ | Total ${ }^{\text {\% }}$ | Per Cent of Gold. |
| :---: | :---: | :---: | :---: | :---: |
| 1850 | 709,472 | 7,801,300 | 8,510,772 | 8,336 |
| 1951 | 606,022 | $7,011,750$ | 7,617,772 | 7.955 |
| 1852 | 746,956 | 7,625,650 | 8,372,606 | 8.921 |
| 1853 | 723,078 | 6,235,922 | 6,969,000 | 10.375 |
| 1854 | 450,288 | 5,029,712 | 5,480,000 | 8.216 |
| 1855 | 555,200 | 4,698,800 | 5,254,000 | 10.567 |
| 1856 | 479,476 | 4,306,524 | 4,786,000 | 10.018 |
| 1857 | 571,700 | 4,447,300 | 5,318,000 | 10.731 |
| 1858 | 489,744 | 4,725,256 | 5,215,000 | 9.391 |
| 1859 | $438,8^{\circ} 0$ | 5,046,120 | 5,485,000 | 8.001 |

The ores of Zacatecas frequently contain argentiferaus blende, which makes them rather more difficult to work than those of Guamnaxuato. Gold was almost unknown in the mines of Zacatecas until 1856 , when a veia was cut in the miue of the "Bote" contaiving large quantities of gold, which still continues to yield a considerable produce of that metal.
Real del Monte produces ores of a very various nature, some containing considerable rquantities of maganese ; as the following analysis of a sample by Mr. Rogers, from Santa Brigida vein in that district, will show :

| Silica. | . 00 |
| :---: | :---: |
| Alamin | 8.00 |
| Peroxide and sulphide of iron. | 7.50 |
| Magnesia, | 1.60 |
| Sulphide of lead. | 2.82 |
| Peroxide of manganese | 5.30 |
| Sulphide of zinc. | 2.30 |
| Lime | 1.45 |
| Sulphide of coppe | 40 |
| Silver. | 25 |
| Potash, antinony, tellurium, traces of \} soda, gold and loss. | 2.38 |
|  |  |

My late lamented friend Mr. Edward Louckner, who has examined these and similar ores very carefully, states that the silver in many cases exists as a manganate. The ore from the various mines of this locality differ very much in their nature and compo-ition, and have consequently to be reduced by different methods: some are reduced by patio, others by barrel amalgamation, and some are smelted, Some of the silver produced here contains sufficient gold to make its extraction a matter of importance.
In the district of Angangueo the silver exists mostly combined with bl-nde avd sulphide of lead, and is reduced by smeiting. The following analysis shows its composilion:

| Sulphur.............. 32.00Iron............ 1344Antimony......... 2.40 |
| :---: |
|  |  |
|  |  |

In Fressnillo the ores worked do no not perbaps exceed trom 16 to 24 ounces of silver per ton, but the quantity operated upon is very large indeed, being about six thousand cargas ( A carga is equal to 300 lbs ) weekly : the grinding is partly carried on by steam power. There is but one reduction works in this locality, but it is the largest of its kind in the world. The ores contain no gold.
The district of Catorce, although now yielding compara-
small blast furnaces. The ores contain no gold.

- In the district of Reyes the ores differ very much in composition, as may be seen from the following analyses :-

Some of the antimony in the second analysis existed as red sulphur. The first analyzis may be taken as an average of the ores worked in this locality, although very trequently antimony is also found in various proportions. By the $P(x-$ tio amalgamation not more than from one-half to threequarters of the silver can be obtuined from these ores, and this only with a large loss of mercury. In examining various samples from this district, we have found part of the silver to exist in the form of silicate, which it is difficult to separate except by smelting; and the ores in general are not sufficiently rich to admit of tbis process being adopted where charcoal is so very expensive and scarce.

In the district of Jalpu a very interesting mineral of silver has been found, which, according to R. Richter, has the following composition :-

Affording the formula $(3 / 4 \mathrm{Ag}$ plus $1 / 2 \mathrm{Ca}) \mathrm{S}$. It has a leadgray colour, and is malleable like ordinary silver-glance. Oleavage monometric, specific 6.877 to 6.890 . Breithaupt has given it the name of Jalpaite. (American Journal of Science, 2 ser., vol. xxvi. p. 358.)
In many of the mineral districts of Mexico there are thousands of tons of low-class ores which would not pay the cost of amalgamation. Various plans and apparatus have been proposed from time to time for concentrating these by washing, but up to the present time we know of none which has proved effective. Some of the machines have exhibited much skill on the part of the inventors, and for many classes of ores I have no doubt they might answer admirably. T'o concentrate these ores they would first have to bo finely ground, because the sulphide of silver, is very intimately mixed with the gangue, and this operation is a very, expensive one in Mexico, having to be done by animal power. Besides, in grinding, the sulphide being softer than the gangue, becomes so fine that the portion which passes away in the water used for washing contains in many instances as much; and sometimes more, silver than the portion remaining behind:

It may not be out of place just to remark here, that besides its wealth in silver, Mexico is much richer than is generally supposed to be the case in other minerals. In the present condition of the country these are of cour e quite unavailable; but they present the elements of great future prosperity when law and order are restored, and proper security given to induce the application of the necessary capital to make them available. Many of these ores are distinc. tive in their composition, and are little known in Europe.
[To be continued.]
Old Iron.-The shipping of old iron from San Franciscote to the East is becoming quite a business, and begins to attrac. attention. Old iron is bought up in San Francisco at ten anr twelve dollars per ton. After going East and being wrough over, the same iron is reshipped to San Francisco and sole for $\$ 80$ and $\$ 110 \mathrm{pr}$ ton. The Bulletio urges the establisi ment of a rolling mill in San Francisco to work up old iron and thereby stop such an unequal traffic as that of selling fo ten and twelve dollars per ton, and then buyiug it back a $\$ 80$ and $\$ 110$.

Red, Wifteand Blue G. \& S. M. Co. Ievied an assessment of 25 e rits per share. payable on or before *Feb. 1st, office cor. Pine and Montgomery Sts.
Mina Prieta S. M. Co.-An assessment of \$10 per share was levied. Dec. 26, 1862-payable at office, cor. Montgomery and Jackson Sts., on or before Jan. 26, 1863.

## Company meetings.

The Cocheco Co. will hold a meeting at No. 606 Montgomery St., on Monday, March 2nd, for the purpose of reising By-Laws, etc.
Chs. Caney Co-Special meeting of strckholders will be held on Wednesday, March 18, to consiaer the propriety of an increase of capital stock.
South Utah Co. will hold its annual meeting for election ef Trustees, etc., at No. 608 Merchant Sit., March 20.
Nevada Co. will hold its annual meeting for electing Trustees, etc., at 608 Merchant St., March 20.
Potosi Co.-Annual meeting will be held at Office, in this city, March 3d.
Aunie Laurie Co. will hold its annual meeting for election of Trustees, etc., March 19.
Santa Rosa will hold its annual meeting, March 5, at Tucker's Hall.
Desert Co. will hold its annual meeting, March 4.
Davey Co. will held its annual meeting, March 2.

## ASSESSMENT SALES.

Texas Co. will sell delinquent shares, on the 14 of March. Meredith Co. will sell delinquent stock, March 2 n .
Coso Co. will sell delinquent stock, March 18.
Moray Co. ( V. City.-Surts for delinquent assessments will be commenced, March 14.
Michigan Co. (Gold Hill) will commence suits for delinuent assessmenis, March 16.
Sales of Stock for non-payment of assessments are advertised to bo sold as follows :-
North Potosi Mining Co.-Sales deliquent stock will e made March 17 .
Peytona G. \& S. Mining Oo.-Sales of delinquent stock vill be made March 1st.
Cole Silver Mining Co.-Sales by Jerome Rice \& Co., 327, Montgomery St., San Francisco, on the 25th of February.

Combination G. \& S. Mining Co.-Sale by E. S. Spear \& Co., at 433 California St., on the 10th day of March next
Lady Bryan G. \& S. M. Co.-Shares of delinquent stock-
holders will be sold at auction for assessments, at No. 400 , Montgomery steet, on Jan. 27.
Desert Mining Co.-Shares of Selinquent stockholders will be sold at auction, for assessmonts, at No. 400, Mont gromery street, Jan. 27.
(emerin, nutices
Jenny Iind (Esmeralda.)--()wnets of ground in this Co. are requestes to call and sign deed of truot at 608 Nerchant St.

Mount Hope Co.-Persons claiming stock are reqrested to present title papers for examination till March 16.
U.S. Mining Co.-All persons claming stock are requested to present title papers for examination at Nos. 7 \& 8 Govermment House.

Caution.--D. M. Tyrell warns persons acrainst purchasirg a certain 10 feet of pround in the Wellington ( $o$ o., standing in the name of J. J. Margee-also 20 feet, standing in name of W. Williams. (See 'Ierritorial Euterprise.)

Ashland Co.-I. A. Gould, in the name of the Moss Co. notifies the Ashland Co. that tbeir westerly drift has cut the Lambledge in the Moss Co.'s ground, from which the Ashlaud Co. is forbidden to extract any valuable metals.

Coso Silver Mining Co.-The Office of this Company has been remored from the Sterenson House to Nos. 11 and 13 Court Block, No. 636 Clay street between Montgomery and Kearny. Entrance on both Clay and Merchant atreets.

Henry Martin G. \& S. M. Co- "Thomas Wallace, Trustee." gives notice that whereas certain parties illegally claiming to be Trustees of this Company, huve changed the name of the Corporation to the North Star G. \& S. M. Co., and illegally elected olficers for the same, the public are cautioned accainst such acts, etc.
Tue Sirfeney Co., Gold Hill, give notice that Baltic Company have wrongfuly claimed and worked their ground since July, 1860.
The Chmaer Rocr Co., lying next west of the Tirginia Co. claims hare notifed the Hazel Green, Tingley and Biach \& Paxton Companys that they are tresspussing upon the Chimney Rock Co's ground.

## ESMERALDA MINING NOTICES.

The Zenobia Lode Coarpany, give notice that they claim a superior title to the Johnson Co., claiming the same ground, so far as said localities couflict. This ground is a portion of that now held by the Company known as the Wide West Company. The notice is signed by A. Waddell, J. C. Dorsey, S. P. Dorsey and James Elder,

## MINNNG AND SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICL AND SCIENTLFIC PAPER ON THIS CONTINIENT.

## THKRD XEAR: VOLUMIE VL-NEW SERIESI

A new volume of this extenswely circulated paper commenced Scpt. 11, 1862. It is intended that every number shall bo replete with information concerning Minsug, scientific, Blechazical and Industrial pursuits, together witb sereral original engravings, of new inventions, etc., prepared expressly for its columus.
This paper is devoted to the above purposes, together with the interests that may be of interest to the reader. : and it is the iutention of the propretor tospare no pains or expense in makiag it equal in interest and valuable information to any paper yet published.

## The Mining Interest $/$

Will find it of groat value, as it will contain all the news appertaining to Mining, the prices and sales of Mining sitocks, new ioventions of dachinery akinpted to tizat purpose, and of everythug gellerally that may be of sorvice to tho Miner.

## The Inventor I

Will find it an excelient medium for the purpose of bringiog his invention into motice, of ascertatinity the proveress of invention in this and uitier countries, and also of receivivg any information that mathe necessary in obtaining his pateut, the preprictor having had great experience as a
Patent Agent, together with facslities at WasLington that enable him to olb Patent Agent, together with
ain Patents with dispatch.

## The Mechanic and Manufacturer !

Will be greatly benefitted by its perusal, as each number will contann sereral oripinal engravings of new machines and iaventions, togethor with a large ammut of reading inatter appertainng thereto. We are constantly
receiving the best scieutific journals fiom all quarters, from which we shall continue to extract whaterer may be of benefit or interest to our readers.
To Chemists, Architects, Millurights and Farmers! This joumal will be invaluable. All new discoreries in Chemistry will be
giren, and a large annonut of mformation of great service to Arclitects and
Millwrights will be founl in our columis. The Farmers and Planters will not le neglectel, engravings will be given of cyricultural implements, and the farming iuturcest gencrally will beamply discussed.

tery str'3els, Nau Francisco.

TO COPPER MINERS AND COPPER PROSPECTORS
We hear much said, at the present time, among copper miners and prospectors for copper, with regard to "indica tions" of this mineral. As a general rule our copper miners consider that "gossan" is an in lallible indication, and it is furthermore stated that this "gossan" is found in greatabundance. The following article, treating upon the Gossan of the Cornwall mines, which, we extract from an English scientific periodical may, perhaps, be of value to some of our California copper miners :-
"This gossan, of which I have examined a great number of samples, from the 'Silver Vein Mine' at Lostwithel, differs notably iv colour and general appearance as we pass from one sample to another. Most specimens, however, give a yellowish brown powder, sometimes inclining to red or white. Like all gossans, that from the above named mine, is composed of quartz and oxide of iron, but it is remarkable by the fact that it always cotains a certain proportion of silver. Its densily varies from 2.66 to 2.75 , and its general composition oscillates between the two extrenue results I and II.

The quantity of quartz raries, then, in this gossan from 10 to 85 per cent ; but it passes here and there into com pact quartz, \&c.

I have found that the silver contained in this rock exists in the state of sulphide of silver, combined with sulphide of antimony, copper and iron. The mineral which contains it is fahlerz, or grey copper, and it is dispersed gel erally throughout the gossan, being often invisible to the naked eye But in some specimens where the quartz is compact the grey copper shows itself in veins and plates, and where this is the case the quantity of silver is considerable. Regarding the percentage of metalic silver, I chose the following from a considerable number of assays executed in my labratory during the present year.

These analyses show that most frequently the Cornish gossan gives 0.04 per cent. of metalic silver, or 4 pounds of silver for every $10,000 \mathrm{lbs}$. of gossan, which is about $14 \frac{1}{3}$ oz of silver to every ton of gossan, and that where it passes into compact quartz, showing veins of grey copper, there is a great iucrease in the proportion of silver and a considerable proportion of copper."

If the gossans of California contain silver, even in small proportions as the above, it would be well for the mivers to have all such mineral deposited by itself, as some dayit may be trorked for silver, to a great profit. If not in our days, perhaps it may in those of our grand children. Consequentlg , since the saving of it will cost us nothing, and as a probability exists that we may want it ourselves, it is our duty to act with economy.

Treasure Shipmens on the 21st ult.-The shipment of treasure on the 21st ult was as follows :-

Hfaty Mining Transaction--H. F. Wood has disposed of his interest-one-half-in the Independence Quartz Mining Company, at Sierra Buttes, to E. Said, for $\$ 60,000$

## THE "KEITH DESULPHURISING PROCESS."

A new process for working gold-bearing rock has recently been introduced into the Pike's Peak quartz mines, which is described as follows in a late number of the Denver News:-
We have delayed speaking at length of the new gold saving process, until able to give a definite resnlt. It seems that the first report of its operation was greatly exagerated in amount, though not much in proportion-though we have talked with those who said they had handled the gold, and voluntarily vouched for the truth of the report as we pub lished it.
The first experiment, as we since learn, was upon one-third a ton of ore-iron pyrites-from the Gregory lead, which
ha been paying. by the common process of milling, about one hundred dollars to the ton. The new apparatus was six hours in workiug it, and obtained one hundred and sixtyseven dollars and fifty cents to the ton. At the conclusion of the experiment it was found necessary to obtain greater of the experiment it was found necessary to obtain greater power, and operations were stnpped to set op a
engine, which will very soon be ready for work.
The modus operctudi, as explained to us, is as follows :The ore, as it comps from the mine, is first passed through a "stone-breaker," identical with, or very similar to, the machines used in the States for breakiug stone to macadamize roads or streets, which reduces it to pieces about the size of hulled walnuts. It next goes, dry, through a mill similar to the patented quartz crushers known as the "Young Ainerica." consisting of a hollow iron cylinder, not unlike, in appearance, a great griudstone, and of great strength, the inside surface of which is cor. ugated like the griading surface of a coffee mill or iron corn mill. Passing through the centre of this cylinder is a shaft, to which are attached arms which revolve just clear of the corrugated surface above describerl. This shaft is made to revolve at a rate of fifteen lundred revolutions a minute. The rre is introduced through a funnel like opeaing in the side, taken up by the arms of the revolving shafi, and hurled amainst the rough surface of the cyliuder, until reduced to an impalpable powder, when by the draft of the rerolving arms it is driven out through long pipe, into which a flame of iutense heat is introduced In passing through this flame it is desulphurized; the sulphur, arseuic, and other kindred substances which prevent amalgamation, are completely destroyed, and the crushed ore escapes from the furnace ready for amalgamation with quicksilvei. T'o effect this, it is conveyed to a large arasta, which is ined with galvamzed plates. Here it first comes in cont tact with water, and the great revolving wheels stir it until every particle of gold is brought in contact with quicksilver, and is deposited in the form of amalgam. A stream of clear water is then introduced, and all the refuse or tailings is carried off.

Such is the theory and principle of the uew plan. It remains yet to be seen whether the first is perfect in practice, and the latter beyoud improvement. But even with the present result, it seems destined to wurk a revolation in gold mining. It has long been the belief of our best miners that our mills bad, under the most farorable circumstances, succeeded in saving only from ten to twenty per cent. of the gold contained in the gold handled; an opiniun which seems to have been already confirmed by this singular experiment, in which the field mereased more than five fold. We wait anxiously for further tests, and are assured that the next trial will give a still more favorable result.

This "process" is also referred to in a letter from the well known "Dan de Quille," late mining reporter of the Territorial Enterprise, which will be found in another column of this paper. It appears that much is expected from it, by the miners about Denver City.

The principle is not a new one. It was employed several years ago at the Llanelly Works, near Swansea, England, to separate sulphur, arsenic and other rolatile ingredients from copper ores. After a thorough trial, it was found impracticable, and abandoned. No advantage was gained by this process over the usual reverberatory furnace, either in economy or completeness of desulphurization. So far as we can learn, the "Keith Process," presents no advantages over that employed at Swansea. If flames of such "intense beat," as described in the News, are introduced, can they be so regulated as to prevent the melting of the sulphurets, before getting rid of the volatile ingredients which interfere with amalgamation? The Denver paper promises to give, in a future number, further results with regard to the working of this process, which, when received, we shall transfer to our rolumns.

A Profltable Railroad.-It is said that the net earnings of the Panama railroad, for 1862 , have been equal to 30 per cent. on the entire investment.

MINES AND MINERAL INDICATIONS ATONG THE OVERLAND ROUTE.
"Dan de Quille," who recently left Virginia City, by the Overland Route, for the East, is writing to the Territorial Enterprise "Notes of his Trip Across the Continent." The following extracts from his lact published letter contain matter of some importance to California miners:-

I am stopping ar the Planter's House, the principal hotel of Denver. There must be over a hundred regular, board ers at this house and there is a constant stream of transient custom pouring in frum the States and the mines. Here we have the same style of dress and the same faces that we meet with in the mining towns of California and Washoe, and those about us talk of ores and mills. A. Califoruian or Washoeite is quite at home here.
the beaver head mines.
There will be many persons go from here next month to the Beaver Head mines. All who have been there speak well of the mines, and all are going back. A friend from Salt Lake City, representing a Gentile company of that city and $\$ 30,000$, arrived here a day or two since for the parpose of purchasing a mill for the Beaver Head mines. The mill is for one of the veins of quartz I mentioned in my letters from Salt Lakc. 'I'he gentleman has brought most of his teams and will go up to the mines in a day or two to buy the mill. His company already have ugents at wark in the Beaver Head country, looking out to secure good leads. Some ten of the heaviest Salt Lake merchants and capitalists are enlisted in this enterprise. They have more exact information in regard to the mineral wealth of the northern country than any parties here or elsewhere, and know just what they are doing.

## mineral indications on tgr route.

In regard to mineral indications between here and Salt Lake, I may briefly say that after leaving the Mormon metropolis the first quartz country observed by me was that bordering on Silver Creek. This is a belt of mineral country of forty or fifty miles in width, and I think good veins of silver ores might be found within it. After crossing the Weber we have nothing but sedemintary rocks till reaching the Black Hills. The Rocky mountains. Where we crossed then, are purely sedinentary-no sign of any other rocks, or of precions netals. Coal, however, is found in many places, and if looked for, could doubtless be found in nearly every place between Heho canon and the Black Hills. In the Black Hills I saw several veins of quartz, but as night overtook us soon after getting into the range I had but little opportunity for examining the country. I have visited the best mines in the vicinity of Central City, Black Hawk, Nevada City, Eureka and Mountain City; also a number of mills in these places. I securt d-specimens from many veins which I will test on reaching the states, and meution more particularly in some future letter. I may say, however, that I found a great amount of ore almost precisely similar in appearance to the argentiferons ores of the Humboldt, Reese river, and Galena; (Pleasant Valley or Steamboat) mines. Some of these contain a very considerable amount of silver.

The kettit process.
I saw, while in the mines, a dew process. It is quite interesting and I will send you a full description soon after getting lome. I thiak both the crushivg and desulphurizing apparatus will be a good thing in $W$ ashoe.
This "proc. $8 s$ " is fully described in another column of the Press.
Ore Tests.- Several inquiries have been made to as of the different chemical tests that will discover traces of silver and copper in the rock. If our friends who are conver sant with this matter will forward information respecting such chemical tests to us, we will be happy to give thom publicity. [Amador Ledger.

Persons interested in the above will find the desired information, and much more in the same connection, all valuable to copper and silver prospectors, in late numbers of this paper. A remittance of six months or a years subscription to the Mining and Scientific Press, will afford them all the valuable information obtainable from books in relation to prospecting for either silver or copper, and assaying and testing ores of the same. The dissemination of that class of information is the speciality to which this paper 18 devoted, and no mineral prospector in the silver and copper regions of Californja can invest $\$ 4$ to better adrantage than by sending the same to this office and becoming a subscriber and reader of the Press. We shall be extremely happy to receive the names of all who may favor us with cash patron age. We also pledge ourselves at the expiration of the year to refund to any party double the amount of his subscription, who may honestly think he has not got the worih of his money in valuable information from our columns.

## WASHOE STOCK REMARKS．

［Compiled from the Daily Terrftorial Enterprise．］ Tokspay Eventigg，February 17th．
The wires between Virginia City and San Francisco have been down to day，and，as a consequence，transactions bave been rather limited．The evquiry of＂What are you pasiug for to－day？＂has been answered by
the brokers with＂The wires are down．＂If San Francisco capital does not regulate the price of Virginia City stocks，it in a groat moasure creates the demand．Burnside，which gave such promise of fluctuation yesterday，has been ominously quict to－dny．Hoiders are afraid of selling at a price too
low，and brokers，in the absonce of advice from the Bay，are not disposed to risk much of an advance．It is sparingly offered，however，at $\$ 60$ ，with－ out takers．There continues to be some dealing in Yellow Jacket at $\$ 175$ tol
$\$ 200$ ，and in the Union at $\$ 14 @ \$ 15$ ．The case of theso two companics will $\$ 200$ ，and in the Union at $\$ 14$（3）$\$ 15$ ．The case of these two companics will
scarcely be reached this term of Court．There is a lull in Zonave，but none can be had for less than $\$ 10$ ．An advance is anticipated by holders．Bul－ lion is in request，and large quantities might be disposed of at our quota lions of yesterday．We quote Yollow Jacket at $\$ 17 \overline{\text { L }}$ Lo $\$ 200 ;$ Union at $\$ 15$ ； （a） 37 ；Oriental \＄4（1）\＄6；Harol Greon \＄t＠ 85 ；Bolviders $\$ 3$＠$\$ 10$ ；Beach A Paxton $\$ 35$（13）$\$ 40$ ；Pride of Washoe $\$ 15$（a）$\$ 20$ ；North American $\$ 1$（6）
Wednesday Evenive，February 18 li. Something substantial has been aone in stocka to－day．Many of the la
gest transactions，howevor are not mado public．Thero has been much ac－ tivity in Buruside．San Franciscu operatora avem suspicious and touch sparingly．The highost offer to day has been $\$ 60$ ．There is little in mar－ ket，Lowever at theso figures．There is a largo domand for Zouave at $\$ 10$ and 12 bas been offerod．Moseow has beeu in request at $\$ 10$（3）75，but as has been some dealing in Bullion nt our quotathus of yesterday．Yollow Jseket is iu demand at $\$ 175-200$ is asked．Uoion is anleablo at $\$ 13$（a） 15. Winu，the principal owaer in the Irving，ts exhibitiog very，fair looking ore from that claim．It is limited in quantity，however．With the exceptions uoted，our quotatlons remain at our figures of yesterday．

## Thursiday Evrniwg，February 19th．

This has been one of the most stormy and disagroeable days of the sea－ son，but trade has been quito active novertheless．After slumbering for Six months，the Cole ruddenly awoke to notice，to－day，aud a number of Franclsco operators．Burnside has been inactive nad is evteontly on the deoling．There bave been no offern for it to－day．Texas is advanoling at a moderate pace，and selling at $\$ 5$（＠） $5 \frac{1}{2}$ ，assessmeuts paid．Bulliun is in continued request，and 50 foct changed hauds to－day at private rates，In Zouave there ss stll some denliog at $\$ 11$（a3）12．This stock can rendily be sold at these tgures．Oriental as meeting with some favor，and huldera are expectiog to cut the ledge again in a fow dnys．It is still in the markot， rates，but little or none is offering．Fifteen feet Uuion sold at $\$ 15 ; 5$ feet Birdsall sold at $\$ 20 ; 20$ feet Texns at 5； 150 feot Cole at 20； 10 feet Pride of Was hoe at 15； 25 feet Sinaloa，Gold Hill，at 8 ．This latter Company lias recently struck what is supposed to be the south extension of the Crown Point Ledge，and holders are looking for large figures．

Frinay Eventig，February 20th．
Tbere has been considerable lifo in stucks to－day，and the promise for to－morrow is better．The demand for most stocks of accepted value es－ eceds the supply．Such a condition of the market in of courso exceoding－ ly gratifying to bolders，and speaks well for the estimation in which our milues are held．Burnside has been inactive．Operators are careful，and holders nervous．Fifty doilars is the most that has been offered，and this sparingly．But little has changed hands．The Milton excitement seems to havo subsided，aud operations in the stock have apparently coased．We cannot pretend to quoto the price．Bulliou is in request at $\$ 30$ ，but litte can beobrained at these figures．Tho Pride of Washoo is advanelng，and caunot be quoted at less than $\$ 25$ ．Wo havo befrere us an assay of ore from this cluim which shows $\$ 216$ to tho ton－$\$ 171$ in silver and $\$ 45$ in gold． Sicramento is in demand at $\$ 60$（a3）65－about the Bay rates，It is held frm， ly at higher figures．Beach and Paxion is in request at $\$ 40$＠ 50 ，but nove is to be had at these rates This is a small claim of 233 icet，and bold－ ers are lonking for a wild adrance．Nortod is inquired for，as woll as its paid．Within the past ten duys this stock has a dvanced frum $\$ 150$ to $\$ 7$ per share．Fifteen dollars is offered for Zonnve，to fill orders from below， and thare is some inquiry for Gov．Nye at $\$ 5$ to 6 ．There is somo talk of a strisc，or all approaching strike，at Flowery Hill，but we can trace the re－ nort to nothing reliable．The Sauta Rita Company struck the ledge in their tunnel iu Spanish Ravine，north of the Cole Company，thts morning．Five specimens of sulver were tuken out．

Saturday enemavg，Feb． 21.
Stock transactions today have been quite unmportant．Burnside is
quiet－very vuiet－with no bids of momeut．It is offored in small lots at quiet－very vuiet－with no bids of momeut．It is offered in small lots at
$\$ 45$（s） 50 ，whthout takers．Bullion is exceodingly active．Ffty feot sold this morning at $\$ 30$ ，and in the afternoon $\$ 35$ was freely offered for large and small luts，without accommodation．This adyance is owing to no excite－ ment．The location and prosimity to the ledge seem to be the basis of the aulmation．Texas is still in demand at $\$ 7$（1） 8 ；and $\$ 10$ it is reported has been offered．Sacramento continues in request at $\$ 60$ to 65 ，with little off－ eriug．Thore is less inquiry for Zouave，but the stock is generally hold firmaly for an advance．It may be quoted at $\$ 15$ ．There is a light de－ mand for Cole at $\$ 20$ ．No transactions in this stock are reported to－day．

## ESMERALDA STOCK LIST．

［Corrected Weekly for the Mining and Scientific Press．］

## From our Edition of Feb 10th <br> MINING EDUCATION.

In our last issue we referred to some of the disudvantages under which the California miners, as a class, labored by reason of the lack of a proper Mining Education. We also adverted to the fact that the popular antipatioy against the application of science to mining, which wasso prevalent among California miners, six or eight years since, has lately been pretty much laid aside. It is now very generally conceded that an empirical knowledge of mining is not the way to succeed in that difficult and uncertain branch of industry. The occurrences connected with the discovery and development of our silver and copper mines have produced such a change in public sentiment that, at the present day, it is rare to find a man who will openly avow, even if be secretly entertains, a beliaf in a necessary antagonism between theory end practice. Practice and science have now joined hands in the mines, and the time has passed when the former will venture "to go it blind" in the vain confidence of shallow empiricism, upaided by science.

The attainment of a passable mining education, when proper facilties and instructors are at hand, is not a work of so much time and study as many suppose. The dificulties .and mysteries involved in becoming an expert in planning and working a mine, and in acquining a practical knowledge of their geological and mineralogical characteristics, are no greater than are to be met with in many other subjects in the usual programme of practical and theoretic education. Experience is the foundation of success in all human undertakings; but the only value of experience is the facility which it affords us to deduce from previous results, a knowledge by which to overcome uev or greater difficulties. This is identical with the inductive process of the man of science. But he that confines himself to his own limited experience, shuts his eyes against the lights of science; and, in despising the experience of others, he will soon find himself burried in the darkness of empiricism, while those who have entrusted him with their business will surely behold their undertakings enveloped in a labarinth of difficulties, which must sooner or later result in common and promiscuons ruin.
A large mine is a complicated machine, and we might with quite as much propriety place a ploughman, with no mechanical experience, whatever, in charge of a double cyl. ender printing press, as to place a man, whose experiencein mining is confined to what he has done himself, in charge of a mining operation of any magnitude. The art of mining involves ar general knowledge of mechanics, surveying, mineralogy and geology. To understand working a mine-boring, sinking, pumping, winding, stopeing, hauling and ventilation a tolerably correct knowledge of every leading principle in mechanics is needed. Without such knowledge the miner will find it impossible to decide apon the most economical means and arrangements for transport either in the mine or on the surface, the kind and capacity of engines needed, or the character and class of maehinery best calculated to perform the work before him. Laying out the work propererly, each part with reference to another, requires a knowledge of surveying. To ascertain the proper place to sink shafts, involving calculations of the dip and strike of strata, prubability of water, faults, \&c., implies a knowledge of geology : while by the aid of mineralogy only, can he determine the nature and va!ne of the minerals upon which he is working, or which may chance to come in his way. On a correct conclusion with regard to each and all these points depends the success of the undertaking. The employment of experienced men.with liberal salaries, to superintend works of this description may safely be predicted as uniformly resulting in larger dividends to stockholders, and increased safety to mine and workmen. Experience, coupled with a proper application of science, is the only foundation of fitness for the pasition of Mining Superintendent. The lack of these requisites has cost English adventurers millions of pounds sterling-sometimes in the faulty opening of a mine, at others in the lack of mineralogical knowledge for determining the value and character of the mineral when found. We gave several instances of the latter in our last issue, we might multiply instances of the former adinfinitum.
It is to the lack of this latter information that we must atribute the delay in the development of the silver and cop.
their existence should have been known as the result of actual explorations.
There is but one way to remedy the evils here passed in review and provide our State with a competent corps of mining engineers and superintendents- $A$ School of Mines must be established under the patronage and partial control of the State. An institation of this kind is absolutely necessary to a proper development of our resources. We need it as a collector and conservator of mining knowledge past and progressive. We need it as an institution for the general diffusion of information in this branch of indastrial science. We need it as a place where the working miner, the proprietor and the engineer may be drilled and schooled in the art of mining, in all its bearings. Such schools have long been in existence in nearly every country in Europe, where they are fostered with the greatest care by the different governments. We shall endanger our reputation as- a progressive people if we much longer delay a movement in this direction. The losses of property and misdirected outlay of capital already scored up, (to say nothing of the sad loss of life, and laid at the door of imexperience, would have litherally endowed half a score of such schools.
Our State Geologist, in his address before the Legislature two years ago, adrised the early establishment of such a school. We have now a Legislative Committee on Mining. Is there any more important matter which can come before them than that which we are now discussing?. Huve they ever thought seriously upon it? If so, or if not, heretofore, why would it not be well, at the present time, to prepare the general outlines of a plan for such an institution, and let it go before the people, with. a legislative endorsement, for future consideration.
Legislators are quite too prode to think that when they have enacted laws for the creation and collection of revenue, for the collection of debts and the panishment of crime, and, perchance, performed the herculean task of electing a United States Senator, they have fully discharged their leg. islative duties. They forget that thereare other equally, if not more important duties to perform, in providing the means for properly educating the adult industrial class of society. This is universally done in Europe, at least to an extent sufficient to proride competent directors for all the great industrial interests of the land. We have neither time nor space to say more uader this heud than what will be merely suggestive ; but we hold that it is quite time our Legislators should take this matter under consideration, and initiate some steps toward an ultimate, accomplishment of the end in view. The present "let alone" policy must ineritably continue to result in serious losses, both to individu, als and the State, and we shall be fortunate indeed. if our chief industry is not thereby soon completely burried in the darkness of that empiricism in which it is already so sadly floundering.

## From oua Edition of Feb, 16th.

## MINING INCORPORATIONS,

Nolwithstanding the attempts at editorial pleasantry that are so frequently indulged in by our contemporaries, at the lengthening list of miniug Companies, and the cumulative exhibits, of the many millions of capital which they represent, "oc paper," each passing month brings additional evi dence that this wealth is far from imaginary. The constantly increasing values of the figures which appear in our weekly stock reports, appended to the leading mines on the Eastern Slope, are stubborn facts, which must soon make plain to the most unbelieving that the footings of the aggregate "capital," placed" as a value upon the raines now in progress of development, are not much too high. Imagination can scarcely form any adequate cenception of the mineral wealth, which is soon to be developed on the Eastern Slope, and throughout the entire leng̣th and breadth of the "Great Basin," whose Western and Eastern rims are formed by the rocky slopes of the Sierra Nevada and Rocky Mountains. Several of these earliest formed Compauies, which, in the estimation of the great mass of people at that time, fixed their capital stock at an almost fabulous figure, have already reached the immediate vicinty of their incorporate value and their stock will no doubt, ere long, be quoted at a hand-
some percentage "above par." Indeed, one of them has already exceeded its par value and is quoted to dlay at more than 60 per cent. advance.

Numerous others, second and third class mines, are making such favorable developments, at the prosent time, as give good earnest of an early approximation of their stock to par value.
A few years since scarcely a merchant in San Francisco could be induced to invest a dollar in any mining enterpriae. To do so was to lose caste, and endanger one,s credit "on change." Even our foundrymen, could not be induced to invest a dollar, in a business to which they were then, as now, indebted for almost their entire business. Now things are entirely changed, and one can scarcely find a mau in Saik Francisco who does not own "feet" in some mining clajm.
What matter is it if a large portion of these projected companies should fail? All, or even a majority cannot hopo to succeed. A sufficient number, however, will prope so remunerative as to return a handsome aggregate percentage on all the money invested. Hitherto the chief lurden and losses attendant upon opening up the mines of California, have fallen upon the mining community almost exclusively, while the commercial and agricultural interests have been greatly profited at no risk. It is one of the cons ditions of mining, everywhere, that many individual losses must occur, which, however, are always made good in the general aggregate of profits; and it is oreditable to the mer: cantile interest of this city that it has now taken hold of the matter of developing the mines of the State and is freely pouring out its capital for that purpose. The aggregate of these investments cannot fail to be highly remwnerative, and will reward the loosers even, in the increased business which They will create and concentrate in San Francisco. This city owes its very existence to the mines, and it betrays a feeling of selfishness in any man of means, to refuse to do his part in developing the interest upon which its prosperity depends. Every new Mining Company, Fhose organizab tion is announced, is evidence that a new mbue has been discovered, and that somebody intends to spend a little money for its development. Every such item is a matter of encouragement, and indicative that the great interest of the State is progressing. We trust the day is lar distsnt when we shall fail to find in each morning's paper the annoucement that some new mining organization has been effected during the previous day.

## SUGGESTIUNS ABOUT FOREIGN PATENTS.

American inventors should bear in mind that, as a general rule, any invention which is valuable to the patentee in this country, is worth equally as much in England and some other foreign countries. Four patents-American, Evglish,French and Belgian-will secure an inventor exclusive monoply to his discovery among one hundred millions of the most intelligent people in the world.
The facilities of business and steam communication are sucb, that patents can be obtained abroar almost as easy as at home. The majority of all patents taken out by A mericans in foreign countries are obtnined tbrough the Mining and Scientrarg Priss Patent Agency. Having established ageocies at all the principal European seats of Govern. ment, we obtain patents in Great Britaid, Frunce, Belgium, Prussia, Austria, Spain, ete., with prumptoess and dispatch.

Models are not required in any European country, but the utmost care and experience is necessary in the preparation of the specifications and drawingse

When parties intend to tak out foreign patents, engravings should not be published until the foreign applications bave been made.

Caution.-It has become a somewhat common practice for agents located in England to send out circulars soliciting the patronage of American inventors. We caution the latter against beeding such applications as they may otherwise fall into the hands of irresponsible parties, and thus be defrauded of their rights. It is much better for inventors to entrust their cases to the care of a competent, reliable agent at home.

While it is true of Most European conntries that the system of examination is not so rigid as that practiced in this country, yet it is vastly important that inventors should have their papers prepared only by the most competent solicitors, in order that they may stand the test of a searching legal ex amination; as it is a common practice when a patentee finds a purchaser for his invention, for the latter to cause such examination to be made before he will except the title.
It is also very unsafe to intrast a raluable invention to any other than a solicitor of known integrity and ability. Ioventors should beware of speculators, whether in the guise of patent agents or patent brokers, as they cannot ordinarils be trusted with valuable inventions.

 Wheel.
We have received, from the inventor the following description of this Wheel which we give, with the accompanying illustrations. In consequence of numerous letters of enqui. ry received by the inventor we are requested to state that this discription is presented in place of the circular, the publication of which will neccessa rily be delayed for a short time.

It has been the object of the inventor to produce a bractical water wheel, alapted to the peculiar neressities of the Pacific Joast-one that shall be imple, compact, durable nd effective-rendering he small streams, which umble down from the mountain ranges as available for waer power as the larger and more sluggish ones which flow harough the the valleys. Although the principle upon which ais wheel is based is in some respects what is usually termd "reaction," still its construction is such that the action f the water is direct, and it is exclusively a "pressure heel," the water having nowhere in its passage a higher elocity than three or four feet per second.
The above engraving is a representation of the wheel as is applied to high falls. The water is conveyed in sheet on pipes from the ditch or flume, admilted at the top of ecylindrical caseing enclosing the wheel aud discharged rough the draft pipe at the bottom. In Fig. 2, one half the casing is removed (the two halves are alike) showing e interior and also a view of the wheel, which consists of ree steel blades or buckets diverging gradually from the antral brass collar between which the inside contact flange the buckets are clamped and adjusted to give the requir1 openings between them.
The buckets revolve in the space between the annular own confining the water in its passage to the openings the ample space around the wheel allows the water to apoach it from all sides, with the full preasure due the fall; id the effective pressure upon the convex surface of the rckets in the direction of the arrow, is as their inclination which the openings between them is a measure. When e velocity of the wheel reaches 60 per cent. of the velocdue the fall, the tendency of the water toward the openg ceases, and it passes directly to the center of the wheel, ssing inward the depth of an opening, while the wheel is iveling the length of a bucket. A.s the water passes $\mathrm{th}_{\mathrm{e}}$

allowing the water ample room for its passage intu the draft pipe below.
The tendency of the water to go directly to tha center of the wheel, with a constant pressure due the fall, on the whole convex surface of the buckets, and in a slow smooth and even flow, is in accordance with both theory and practice, and requires no directing surfaces, guides, or shutes, to give it that direction. The practical working of the wheel shows that the result is secured by the curve of the buckets which is such as to give the water a uniform motion through the wheel (in whatever position they may be adjusted) and to their cutting edge and finished surface and to the rapidly changing position of the opening between them which does not allow time to overcome the inertia of the water or draw toward them.
The pressure of the water is equally destributed around the wheel. There is therefore no pressure on the bearings, nor is there any lateral pressure.
To secure the perfect running of the wheel between the annular crown, without leakage or friction, the bearings of the shaft are placed in hexagonal boxes lined with lignumiritæ, and adjusted by set screws, as is shown on the hubs on each side of the casings. In these bearings, in. the solid and unyielding cast iron casing, and with the wheel fuished in a lathe aud perfectly balanced, there is no vibration or trembling, when running at high velocities ; and the least possible amount of friction.
Provided elear water cannot be obtained for lubricating the bearings and sealing them to exclude the air from the draft below, oil may be used and hemp packing on the inside of the bearings.

J. II, BETH'S HYDRAULIC PRESSURE WHEEL.

Fig. 2.

Muddy water does not injure the buckets, as a small space is allowed between the edge of the buck ets and the crowns, without loss from leakage, it being counteracted by the centrifugal force imparted from the velocity of the wheel.

One of the most distinctive features of this wheel is the simplicity and economy with which it is applied to different kinds of machinery.
For Circular Saw Mills, it is so constructed as to give the required speed when placed on the saw
opening, it is divided by the central flanges and collars, one half passing off at each end thro, the crown; the whole inside being left open, arbour. A 16 -inch wheel put in operation last fall, near Aurora, N. T., drives a circular saw with power sufficient to cnt 1000 feet of boards per hour.
The wheel is placed on the saw arbour and 18 feet above the foot of a fall of 40 feet.
In building a mill of this description no sawed lumber is required before putting it in operation. A site being selected, not more than 27 feet above the level. of the back water, (the draft cannot well be made perfect beyond that point, and perhaps not even to it, at high altitudes, it being limited by the extent of the atmospheric pressure; as far as it goes, however, it is fully equivalent to the direct pressure ahove the wheel providing the draft pipe is air tight and terminates in the back water below,) sleepers are bedded into the ground upon which the carriage and wheel are placed. The water is conveyed to and from the wheel in a sheetriron pipe.

The durability and economy of this mill (its cost is less than half the usual amount, ) and the ease with which it is almostinstantly stopped and started and the speed controlled, are qualities which will be appreciated by those acquainted with the business. Small whoels may be applied with the same advantage to shingle saws, to small mills for grinding grain, and various other purprses. When the required motion is slow, as in quartz mills, the wheel has a great leverage, and the speed is reduced with light belts and pulleys, and with little wear and tear, compared with what would be required for raising speed from a lower velocity.
For flour mills the wheel may be (on falls of any considerable hight) placed on a level with the pulley on the spindle of the stone and the power transmitted by a single belt, while the position and speed of the wheel affords equal facilities for driving the other machinery of the mill.
The inventor of this wheel knowing that its success depeads entirely upon the proper application of the priacipl has each wheel constructed in accordance wih his own spe
cification of size, proportion and finish, to suit the hight of fall, quantity of water, at differ eut times and seasons of the year, and the purpose for which it is to be used; and as the wheel is complete and in runuing order on leaviag the shop its application is, easy and success certain in the hand of any mechanic of ordinary ability. When the wheel is applied to low falls the outer or cylindrical portion of casing is removed aud it is placed in the open floons, the size being made to suit the volume of water.

The speed of the wheel is exactly in proportion to the quantity of water passed through it therefore a self-acting gate which regulates the supply, regulates the speed accordingly. This has been found to work perfectly in practice.
The guarrantee upon which the wheel is furuished is that it shall equal in power the Overshot Wheel. No regulascale of prices can be given in consequence of the differ ent degrees of finish; proportions and applications required. It is however much less than that of the most perishable wooden structures of the kind.
Full information concerning the wheel may be obtained from the inventor perscnally, by applying at the Miners' Foundry, on First Street, Sun Francisco, or by addressing
J. M. BETH.

Mriners' Foundry. Sau Fruacisco.
[From mex Loxdoy "Mhitica and Subtinva Magazim."] THE MEXICAN METHOD OF AMALGAMATION.

BY JAMES NAPIER, JON., F. C. S.
Late Chemist and Assayer to the Guauaxuato Mint, Mexico. [conttyoem.]
In the introductory section I gave a brief sketch of the history of the Patio amalgamation process, and a few analyses showing the general composition of some of the silver ores in certain of the Mexican mining districts. In the present section I propose describing the methods employed for grinding the ores and separating the gold; it being undorstood that my deseription refers particularly to the district of Guanaxuato. As toe mode in which the sales of the ores are conducted is characteristic, I may be permitted to give a prefatory notice of it.

Some of the poorer mines of Guanaxuato are worked by what are called "Buscones" (searchers.) These are miners answering to the Cornish "tributers," who work without any definite pay, but receive half of the value of the produce they extract from the mine. At stated times a sale takes place at each concern, when these buscones arrange in separate lots whatever they may have extracted since the previous sale, in the court-yard of the mine: These lots of ore are cunningly laid out, so as to expose the richest portions to the view, some showing much taste in their arrangement; and each miner stands near his own lot and keeps it constantly sprinkled with water, which has the effect of making the mineral look darker and richer.

The various "Rescatadoras" (purshasers) take from each lot a small portion of ore, as average a sample as possible, which they have finely ground, and tried or assayed on the spot. This is done by placing about a handful of the ground ore in a "Jicara" or sinall round bowl, washing away the whole of the earthy particles, and judging from the metalic portion remaining of the richness of the ore. It is realy astonishing to marl how by this rude process those who constantly practise it are able to arrive at results so near the truth. However, many purclasers have assays now also made by fire for greater accuracy, and in this case the samples are obtained the day before the sale. These assays are either made by scorification, or by smeiting the mineral with red lead, crade carbonate of soda, a lit tle charcoal and salt, and cupelling the resulting button of lead.
At the regulated hour for the sale a bell strikes, as a sig. nal that it is about to commence. The person entrusted with the sale takes his place successively at the foot of each lot, and every buyer in tura whispers into his ear what he wishes to give for that parcel. When all have given in a price the lot is called over to the highest bidder, the rate of his bid being uamed; where two buyers bid the same amount,
the first hidder gets the preference. The person acting as the first hidder gets the preference. The person acting as
auctioneer and the rescatadores thus move from lot to lot till the whole of the ore in the yard has been disposed of. The weight of these lots of ore is not ascertained by weighing,
u thas to be judged of by the eye. This, like the trying of the ore, is accomplished by those who have had long practice with remarkable accuracy; and; on the whole, one of these sales is rather exciting. The moment a lot of ore is
called out to a buyes, the miner has nothing more to do with it; the purchaser having to remove it from the ore yard to his reduction works, or Haciendes. This is usually done packed in sacks on mules' backs; the ore, if in vers large lumps, as it often is, being previously brokeninto noderately sized pieces. Each sack holds about 175 Dbs ., and two of them are loaded on each mule..

## grinding the ores.

The first operation to which these ores are srbjected is a coarse stamping. "This process is carried out in what are termed "morteros" or "molinos," which are very similar to the stamps used at the Cornish tin mines. The extent of these morteros, or the number of heads, naturally depends on the extent of the "Hacienda," and they are worked by mule power, excepting in a few districts, where steam or water is employed. The ore, as it is fed to the stamps, is in pieces about the size of the fist; as it is stamped, it falls into a piece of strong hide, perforated with small holes, and fixed in an inclined position. What does not pass through the holes is again returned to the stamps, wbilst the finer portion, called "Granza," a very coarse sand, is conveyed to the "arrastres" or fine grinding mills. One stamping mill or battery, with ten stamp heads, worked by six mules which are changed every six hours, is capable of stamping from three o'clock in the morning till seven in the evening forty cargas of 350 ths. each.
[Here follows an illustrated descriptiou of the Mexican arrastre, with particular directions for constructiug the same. California miners are so well acquainted with the principles and working of this machine that there is no necessity for reproducing that portiondiaving reference to it , until we come to the concluding paragraph, which we subjoin.] As soon as the bottorn of an arrastre has been put in, new grinding stones are set to work to grind "Cabecilla"
(the residue remaining after washing a torta) mixed (the residue remaining after washing a torta) mixed with water. This ensures the whole of the interstices being filled up, and is continued for one day, when a second stone is attached. At the end of three days a third is added, when the grinding of poor ores may be gone on with, and after four or five days the fourth stone is added and the fine grinding gone on with.
fine grinding in arrastras and extracting of gold.
In districts such as Guanazuato, where the ores contain gold as well as silver, the former metal is generally in such small quantities that if extracted as an alloy with the whole bulk of the silver it would scarcely pay the cost of extraction, at least in Mexico, but by adopting the plan of leeping the arrastres charged with mercury'during the grinding, the gold is concentrated and made to yield very handsome profits. When this method of concentrating the gold was first used in Mexico we are not at present aware, but Humboldt states that he was informed it was in use in some districts in 1804, but that it was not employed in Guanaxuato, where he was, nor did he see it in operation.
The quantity of ore from the stamping mills charged to each arrastre at one time varies according to circumstances; however, in the best regulated works in Guanaxuato, where the grinding is without doubt carried to greater perfection than in any other district in the republic, an arrastre of the dimensions given above is charged with from six to seven hundred pounds. To this is added a barrel of water-about ten gallons-which is enough to bring the mass to the state of a thick cream. On the quantity of water added depends much the quality of the grinding which will result. Humboldt states that in no part of Europe had he ever seen such fine grinding as in the Great Haciendas de Plata of Guanaxuato. If the arrastre be a new one, or one from which the amalgam has just been removed, there is added from five to ten pounds of silver amalgam : that is, after the arrastre is well "ascentada," or in good working order. Some amalgamators prefer having this amalgaus very "dry," or containing but little free mercury; whilst others again perfer employing it with more mercury. However, it appears to be certain that the less mercury it contains the better, up to a certain poiat. The reason given for adding amalgam instead of mercury alone, is, that if mercury only were added
nould run-immediazely into the crevices of the bottom, spread by the action of the stones over the whole surface of the bottom. This I think is true ; but it is also evident, from experiment, that analgam will take up gold and silver much more readily than pure mercury, and that up to a celextent the freer the amalgam is from mercury the better will it take up the gold aud silver. Might not many of the gold amalgamating michines patented of late years in this country have succeeded much better hàd amáagaì̀ been added instead of so much pare mercury; I meak, amalgam from which only a small quantity of mercury would ooze when pressed between tive finger and thumb.
From time to time the 24 hours (the usual time required to grind the above weight of ore) water is added to the arrastre as follows:-The arrastres are charged about four o'clock every morning, when, as we have already stated, one barrel of water ( 10 gallons) is added; at nine o'clock another, and sometimes one and a half ; at eleven o'clock another barrel and a half; at twelve o'clock one barrel; at three $0^{\prime}$ 'clock, three barrels, and at five o'clock four barrels-in all welve barrels, or about 120 gallons of water. This quantity will vary somewhat with different classes of ores. The g rinding should be so perfect that no grittiness be felt between the fingers when the band is inserted into the mass. As the operation goes on, the amalgam gradually searcles into the crevices of the arrastre. Every second morning, a small portion, called a "Tentadura," or sample of the amalgam ("Pella") is taken from each arrastre, cleaned well with water, and its condition examined. From its "dryness" or "moistness," that is to say, from the greater or less quantity of mercury which can be expressed by pressing it with the thumb against the inside of the "jicara" containing it, is judged how much, or if any, fresh mercury will have to be added to the next grinding ; for the amalgam is notremoved but at the shortest every three months, unless the ores be unnsually rich in gold, when the arrastras are freed from amalgam. The usual amount of fresh mercury added each arrastre during grinding is about half a pound every second day. However, this will vary very much with the ores operated upon ; but as a rule the amalgam should not contain more than about 20 per cent. of gold and silver. At the end of 24 hours, when the grinding is concluded, the "lama" or slime is baled out with wooden bowls ("Bateas") about half a vara in diameter, into a barrel, in which it carried and poured into a place prepared for its reception. In some haciendas it is baled into a small wooden launder which leads to the receptacle ; and in other works each a rastre is furnished with a large plug near the bottom, which when opened, allows the thin slime to ran through conduct pipes to the receptacle. When the slime is moved by hand with a bowl, there is laid on the bottom of the arrastre' $\varepsilon$ small plate of lead or rron, so as to prevent the bottom from being scraped and any of the rich amalgam being removec by the bowl. This operation lasts but a very short time about half an hour, and when concluded a fresh charge graza from the stamps is added, and the grinding arain gon on with as we have described. Two mules, which are chang ed every six hours, are attached to each arrastre. In thit operation there is generally an augmentation of weight the extent of about 8 or 10 per cent. from the wearing aw of the grinding-stones. In most cases the arrastres a arranged in a double row in a house called a "Galera" (ga lery.) The bottom of an arrastre will last ahont twelve month but the "Voladoras" or grinding stones do not not last mon than a month, and in many instances not even so long.

There appears to be an alloy of gold and silver whic will not combine with mercary. My friend, the late M Henry Mackintosh, who had long experionce in these mas ters, stated to me that on two occasions he had found a alloy of gold and silver which he could not get to amalg mate after continued grinding with mercury for six month Mr. Mackintosh could not remember the composition of it alloy, but he thought it contained about 50 per cent. of . 6 ver and 50 per cent. of gold. Sonneschmidt, in speaking the action of mercury on gold states-"On various occasio I have seen native gold finely divided that would not 001 bine with mercury, which I thought was owing to the surfa. being covered with some foreign matter; at the same tir [continvsd on bth Pace.]

SAN FRANCISCO MINING NOTICES. ${ }^{\prime}$
ASSESSNBNTS LEMED.
Asses3ments upou Miniug Stock s have been levied as follows :-

Garabaldi.-Assessment of $\$ 1$ per share, levied March 2nd.

Sutro.-Assessment of $\$ 1$ per share, levied Feb. 23, payable March 23.

Silver Quartz Mill Co.-Assessment of 5 per cent. levied Feb. 23, payable Murch 28.

Helvetia.-Assessment of 25 cts. per share, levied Feb. 17, payable March 10.

Zouave.-Assessment of $\$ 1$ levied Feb. 22, payable Mar. 20.

Rogers.-Assessment of $\$ 5$ per share levied Feb. 4, pay able Mar. 15 .

Sam Wright.-Assesment of 50 cts . per share levied Mar2, payable immediatelg, delinquen's to be sold Apr. 2.

Nupoleon (copper.)-Assessments of $\$ 3$ per share levied Mar. 3, payable in 30 days.
(ioldan Age.-Assessment of one dollar per share levied Fob. 24, payable March 26 .

Washoc Gold \& Silver.-An assessment of 2 per cent. on capital stock was levied Feb. 16, payable Apr. 1.

Rhudes' Diggngs.-Assessment of 25 cts . per share leved Fel. 26, payable Mar. 5.
Texas Co., at a Meeting held Feb. 14, levied an assessment of one dollar per slare, payable to the Secretary in Virginia City.
Santa Rosa Co.-February assessment of 20 cents per share now due aud payable.
Madison Co.-An asses:ment, two dollars per share, was levied Feb. 17, payable immediately, at Ollice, 600 Mer chant St.

Union Co.-An assessment of one dollar per share was levied February 16, payable on or before March $2 \overline{5}$.

Pena Co.-An assessment of $\$ 3$ per share was levied Feb. 5 , one half payable March 1, balance April 15.

Kossuth Co., Devil's Gate District.-An assessment of 10 ets. per share was levied Feb. 7.
Constitution Company levied an assessment of 25 cts. per Feb. 11, pagable immediately.

La Plała Oro Co. levied an assessment of five dollars per share, Feb. 9, payable at Office of the Secretary in Virginia City.
La Plata Co. levied an assesment of 50 cts. per share Feb. 2nd, payable at Ofice of the President.

Alamo Co. levied an assessment of 50 cts. per share, Feb. 11, payable on or before March 20, at 115 Cal. Street San Erancisco, or at office in Carson City.
Tucker Co. levied an assessment of 25 cts. per share, Feb. 11, payable immediately at 608 Merchant St.

Hawley Co. levied an assessment of one dollar per share, ou Feb. 9, payable on or before March 12, to Superintendent at the mine, or Secretary at Olfice.
Slate Range Co. levied an assessment of 50 cts. per share, Feb. 4, payable, March 15.
Moss G. \& S. M. Co.-An assessment of 50 cents per share was levied Jan. 27, payable at 428, Montgomery St., or to the Superintendent at the mine.

White Cloud G. \& S. M. Co. levied an assessment of 75 cents per share, Jan. 27, payable to the Secretary, at 428, Montgomery śt.

El Dorado G. \& S. M. Co.-An assessment of One Dollar per share was levied Jan. 23, payable to the sec. or to the Supt.

Gaudaloupe S. M. Co.-An assessment of $\$ 30$ per share was levied, payablo on or before March 1st.

El Tesora Mining Co.-An assessment of $\$ 11 / 2$ was levied Jan. 27, payable at office on or before Feb. 27.

Polar Star ( . \& S. M. Co. Ievied an assessment of 50 cents per share, February 4th, payable on or before the 4 th of March, at the Uffice in this city or to the Superinteudent at the mine in Aurora, (Esmeralda.)

Dios Padre G. \& S. M. Co. levied an assessment of 3 dollars per share, Jan. 31, payable in 30 days, alsu an assessment of 2 dollars per share, payable in 60 days, at office 502 Montgomery street.

Beckwith G. \& S. Mining Co.-An assessment of 25 cents per share was levied Jan. 24, payable immediately.
Sonora Mining Co.-An assessment of 25 cents per share was levied,Jan 23, payable imnediately.
Overman Mining Co. -25 eents per foot, Jan. 29, payable within ten days.
Ohs. Caney Mining Oo.- 50 cents per share, Jan. 21, payable on or before Feb. 20th.

Sierra S. M. Oo. An Assessment of 82 was levied Jun. 22 -payable immediately, at Office 575 3ission St.
Mount Ilavid:on Co.-An Assessment of 50 cents per Share was levied. Jan. 23, mayable on or before March 1st, at Ufice ti Montgomery lBlock.
Auriatic.-Fifty cents per share, payable at No. 4 Armory Hall, San Francisco, or to the Superinteadent at the Mine
Hattie G. \& S. M. Co.-Thirty cents per share, levied Jan. 31, payable at Office in San Francisco, or at the Mine.
Hale \& Norcsoss-Assessment of T'en Dollars per Share, levied Jan. 31 - payable at the Office in this city, or to John Skae, at the Mine, on or before Feb. 25.
Mina Prieta S. M. Co.-An Assessment of Five Dollars per Share was levied, Jan. 31, payable on or before March 5th-at Office, eor. Montgomery \& Jackson Sts.
Recorder Mining Co.-An Aasessment of One Dollar per foot was levied Jan. 19, payable half on or before Feb. 18, and balance on or before March 20.
Fible \& Norcross S. M. Co. have leviod an assessment $\$ 5$ per share payable on or before Jan. 26th.
Martin White. $-\Delta \mathrm{n}$ assesement of 20 cts. a share was evied, Jan. 2.
Oriental G. \& S. M. Oo.-An assessment of 50 cts per share was levied. Jan. 14. payable at Office, cor. Sutton Avenue and C St., Virginiu City.
Baltimore America Consolidated,-Anassessment of 50 ents per share was levied, Jan. 5.
Savage,-An assessment of $\$ 35$ cents per share was levied, Jan. 7.
Hawley.-An assessment of $\$ 1,00$ per share was levied Feb. 9, payable March 12.
Cole S. M. Co,-An assessment of One Dollar per share was levied, Jan. 10, payable, Feb. 1.
United States M. Co.-An assessment of six and twothirds cts. per share was levied Jan. 10, 1863, payable to the Superintendent at the mine, or to the Secretary, Rooms 7 and 8, Government House, San Francisco.
Sierra Nevada S. M. Co. levied an assessment of $\$ 15$ pe share, Jan. 15-payable Feb. 18.
Lady Bryan.-An assessment of 70 cts. w̧as levied, Jan 13, payable on or before Feb. 16.
Ida G. \& S. Co. (Russ District)-An assessment of $\$ 1$ was levied, Jan. 14.

## company meetings.

Chs. Caney Oo.-Special meeting of stockholders will be held on Wednesday, March 18, to consiaer the propriety of an increase of capital stock.
South Utah Co. will hold its annual meeting for election of 'Trustees, etc., at No. 608 Merchant St., March 20.
Nevada Co. will hold its annual meeting for electing l'rustees, etc., at 608 Merchant St., March 20.
Annie Laurie Co. will hold its annual meeting for election of 'Trustees, etc., March 19.

## ASSESSMENT SALES.

Sales of Stock for non-payment of assessments are advertised to bo sold as follows:-
Oriental Tunnel Co. will sell, on Saturday, Mar. 28.
Mars will institute proceedings against delinquents, Mar 6th.
Planet will institute proceedings against delinquents Mar. 16 th.
Meredith.-Annual meeting of stockholders will be held Monday, Mar. 16, at 2 P. M., at 712 Montgomery St.
Texas Co. will sell delinquent shares, on the 14 of March.
Meredith Co. will sell delinquent stock, March 2n.
Coso Co. will sell delinquent stock, March 18.
Moray Co. (Y. City.--Suits for delinquent assessments will be commenced, March 14.
Michigan Co. (Gold Hill) will commence suits for delinuent assessmenis, March 16.
North Potosi Mining Co.-Sales deliquent stock will made March 17.
Peytona G. \& S. Mining Co.-Sales of delinquent stock will be made March 1st.
Cole Silver Mining Co.-Sales by Jerome Rice \& Co. 327, Montgomery Sti, San Francisco, on the 25th of February.
Combination G. \& S. Mining Co.-Sale by E. S. Spear \& Co., at 433 California St., on the 10th day of March next.
Lady Bryan G. \& S. M. Oo.- Shares of delinquent stockholders will be sold at auction for assessments, at No. 400 , Montgomery steet, on Jan. 27.

Desert Mining Co.-Shares of delinquent stockholders will be sold at auction, for assessments, at No. 400, Montgomery street, Jan. 27.

## general notices.

Yellow Jacket.-Corporate Deed now ready for signature at uffice of H. G. Muynard, Golu IIill, N. T.
Jenny Lind (Esmeralda.)-Owners of ground in this Cot are requestes to call and sign deed of trust ut 608 Mercs an St.

Mount Hope Co.-Persons claiming stock are reqrested to present title papers for examination till March 16.
U. S. Mining Co.-All persons claiming stock are requested to present title papers for examination at Nos. 7 \& 8 Government House.
Caution.-D. M. Tyrell warns persons against purchasing a certain 10 feet of ground in the Wellington Co., standing in the name of J. B. Magee-also 20 feet, standing in name of W. Williams. (See Territorial Enterprise.)

Ashland Co.-L. A. Gould, in the name of the Moss Co. notifies the Asbland Co. that their westerly drift has cut the Lamb ledge, in the Moss Co.'s ground, from which the Ashlad Co. is forbidden to extract any valuable metals.
Coso Silver Mining Co.-The Office of this Company has been removed from the Stevenson House to Nos. 11 and 13 Court Block, No. 636 Clay street between Montgomery and Kearny. Entrance on both Clay and Merchant streets.
Heary Martin G. \& S. M. Co.-"Thomas Wallace, Trustee." gives notice that whereas certain parties illegally claiming to be Trustees of this Conipany, have changed the name of the Corporation to the North Star G. \& S. M. Co., and illegally elected officers for the same, the public are cautioned against such acts, etc.
Tee Sweezy Co., Gold Hill, give notice that Baltic Company have wrougfuly claimed and worked their ground since July, 1860.
The Unmex Roms Co., lying next west of the Virgivia Co. claims have notified the Hazel Green, Tingley and Beach \& Paxton Companys that they are tresspassing upon the Chimney Rock Co's ground.

## MINING AND SCIENTIFIC PRESS.

THE ONLY MYNING, MECHANYCL AND SCIENTIFYC PAPER ON THIS CONTINENR.

## THIRD YEAR: VOLUME VI-NEW SERIES!

A new volume of this extensively circulated paper commonced Sept. 11, 1802. It is intended that every numbor shall be replete with infurmation concerung Mining, Scientifc, Mechanical and Industrial pursuits, together
with suveral originat engraviugs, of now. iuvontions, etc., propured expressly with several originat engraviugs, of now. invontions, etc., propured expressly for its columus
of Scieuper is devoted to the above purposes, together with the interests that may be of interest to the reader' ; and it is the autention of the proprie tor to spare no pains or explense in making it equal in interest and valuable information to any paper yet published.

## The Mining Interest !

Will Gnd it of great ralue, as it will contain all the news appertaining to Dining, the prices and sales of Mining Stocks, new inventions of Machlnery
adapted to that purpose, and of every thing generally that may be of service adap ed to ther.
to the

## The Inventor !

Will find it an excellent medum for the purpose of bringing bis invention into notice, of ascertaining the progress of invention in this ind other
countrics. and also of recciving any juformation that may be becessary countrics, and also of recciving any information that may be mecessary
in obtaining his patent, the prompiotor havior bad great experience as os in obtaining his patent, the pronnictor haviog bad great experience as a
Patent Agent, together with facilities at Washington that enable him to ob Patent Agent, together with fa
ain Patunts will displatch.

## The Mechanic and Manufacturer !

Will be greatly beneftted by its perusal, as each number will contayn several oristinal ungravings of new machines and inventions, togethor with a large amount of reading matter apjertaining thereto. Wo are constantly
receiving the best scientific jourmals from all quarters, from which we shall continue to extract whatever may be of beneft or interest to our readers.

To Chemists, Architects, Millurights and Farmers !
This journal will bo invaluable. All now discoveries in Chemistry will be given, and a largo amount of information of great service to Architects and
fill wrights will be found in our columus. The Farmers and llanters will Millwrights will be found in our columus. The Farmers and llanters will not be ueglectent, engravings will be given of agricultu
the farming interest generally will beamply discussed.

## Terms.

To mall subscribers:-Four Dollars per annum,
Club Rates.
Five Copies for Six Months $\$ 8$.
Teu Copies for Six Montha, $\$ 16$.
Ten Copies for Twolve Months, $\$ 30$.
Twenty Copies for Twelve Months, $\$ 56$.
For all clubs of Twenty and over, the yeariy subscrintion is only 9280 Names can be sent in at different times and from different Post-ofices Specimen copies will be sent gratis to any part of the country.

## EWER \& SMLMH, Pablishers,

Room 27, (formerly) U. S Court Bullding, Corner of Washingtcn and Ba

## THE HUMBOLDT MINES.

Mr. James B. Glasgow called at this office a few days since and exhibited aome fine specimens of silver bearing rock from the Sheba and Ben Franklin veins, in Star district, Humboldt Co. 'The rock is evidently very rich. Accompanying the specimens were several buttons of silver, one of which weighed over one ounce, taken from a small piece of rock from one of the samples shown. Mr. G. informs us that active operations are in progress toward opening the Sheba and Ben Franklin ledges, at different points alung their line of direction. Not less than eleven tunnels are now in progress, upon and approaching these two leads, which run parallel with each other, and less than 1000 feet apart-the Sheba being the uppermost one or the one highest up the bill.

The Ben Franklin lead was first opened directly upon the out-crop, by the Whitmore company, of which, our informant is a member. The rock before us was taken from a tunnel about 30 feet in length, which cuts the vein about 20 feet from the surface. The Union Band company is running a tunnel to strike both leads, and are now 200 feet into the hill.

The Sheba company are still at work upon their ground as described in a recent issue of this paper.

A large portion of the stock of this company is held in this city and the company has; within a few days, beea placed upon a thorough working foo:ing, under the superintendence of Mr. Richard Powning, an expetienced miner. Mr. Glasgow assures us that we were correct in contradicting the rumor started sometime since, to the effect that, a considerable quantity of the Sheba rock had been crushed in Falls mill, near by the vein, with no other result than a generous yield of lead and antimony. No rock from that lead has yet been crushed or amalgamated except by hand process, and the the assays thus made have resulted to the most unequivocal satisfaction of all parties concerned. Arrangements will soon be made for reducing and amalgamating on an extensive scale. The American Basin company has struck the Sheba ledge, in their tunnel and found it very rich. This ledge is about 15 feet thick, instead of less than 15 inches, as stated in a morning contemporary, a few days since. All the ledges in this vicinity are very heary-the Ben Franklin is about 11 feet thick, the San Bernardino 15, and the Mammoth about one hundsed feet thick. The Ben Franklin shows native silver in thin sheets, like strips of tin foil. There are numerous other leads in this, the Star Distnct, which are known to be rich in silver; among which we may mention the Yankee, the Mammoth, the Alamo, Yellow Jacket, J. W. Davis, etc., all of which are in progress of development by tunnels and shafts. Santa Clara joins this district on the North and has many rich leads, upon which much work has been done, by tunnels and shafts, some of the former raving been driven from two hundred to two hundred and fifty feet.
pRINCE ROXAL AND HUNBOLDT DISTRICTS
are also undoubtedly rich in mineral, although not so much developed as those previously named.

> Unionville,
in Buena Vista district is the county seat. More attention has been devoted to the improvement of town property in this than any other portion of the county. It is thought by some not to be so hich in mineral as other portions of the county, but this is probably owing to the fact of its not being so well developed, attention, as already intimated, having been more particularly directed to another chanoel. Another year will probably place it on very nearly, or quite equal footing, in mineral value, with any other district in the county.

## ST. MARTS,

a small district lying between Buenna Fista and Star Districts possesses more topographical advantages fur mining operations than any other in the country, and the best water power in that portion of the country. The same series of leads which enrich Star district, pass through this also, and
probably continue on to Buena Vista. probably continue on to Buena Tista.

There are four mills in the county about ready for opera-tion-three of which, viz.: Dodge \& Co., and Richard Homfray, at Star Clity, and W. C. Fall at Unionville, have already had their machinery in operation, but have not yet
done any regular work. Fall, we understand, has crushed
several tons of Fock from the National lead, but we have heard of no returns.

Judge Watson is now putting up a mill at Star City, near Homfray. Other parties we believe are about locating sites fur mills or have already done so. These mills with the exception of Homfray"s are all to be driven by water, of which there is an abundance the year round. Mr. H. has put up a steam engine, for present use, but will erect a water wheel during the coming summer.

## heaty investments.

Col. O'Connor, of this city, agent for English Capitalists has recently invested some $\$ 30,000$ in extensions of the Sheba and Ben Frauklin leads. Other parties-capitalists -have also invested not less than $\$ 15,000$ in the same locality within a tew weeks past. The above facts show most conclusively, that Humboldt is far from being a "failure," as has been asserted in some quarters. The coming season will doubtleas reveal some most astovishing developments in the distant Humboldt and Reese River regions Weare collecting fac's for a full and elaborate description of the Humboldt region which we hope soon to lay before our readers.

## gold in hembordt.

Gold bearing quartz has recently been discovered about 15 miles Last of Star City. The ledges are apparently very rich and carry coarse gold. A gentleman recently from Humboldt informs the Territorial Enterprise with regard to this discovery, that quite a rush has been going on to the new "Sierra District," in the range of mountains some fif teen or twenty miles East of Unionville, and that locality now boasts a population of nearly two hundred souls. The principal ledges in it are the Crocsus, a marvellously rich gold ledge; the Badger and tho Aunie, silver ledges, and the Great Eastern series of six ledges-also silver. The Great Eastern is forty feet wide, and the Annie and Badger, contain but little base metal, and assay $\$ 9,000$ to the ton Placer diggings have been discovered in the ricinity of the Croesus which yield from $\$ 15$ to $\$ 20$ a day to the hand.

## agricultural derthopments.

Recent explorations are developing the existence of much valuable agricultural land in the region of the Humboldt mines. A beautilul valley, of quite large extent, undoubtedly capable of high cultivation, has quite recently been discovered some 30 miles north-east of Star City. Up to Feb. 21st no snow had fallen, to lay any considerable length of time, in Unionville, and but a few inches in Star City. In the valleys below, the ground had not even been whitened by the wintry mantle, and the cattle there were enjoying themselves hugely, in their inmunity from winter blasts and in the abundance of green herbage.
This region, as soon as spring opens, will afford an abundance of emplosment for laborers, who will be needed to open and develop the mines already discovered. Uniorville, Siar District, contains an abundauce of water power for milling purposes. There is also a plenty of wood for fuel and mining timber. Wood is now selling at $\$ 8$ and $\$ 10$ per cord.
The Reese River excitement still continues with unabating zeal. The town, Clifton, as it is called, recently laid out there, is progressing finely. Thirty or forty new comers recently jumped a large number of lots previously located, but subsequently gave them up to the original owners. The mineral developments are progressing finely. One liundred feet of the Comet ground recently changed hands at $\$ 40$ per foot. Wells, Fargo \& Co. have already established an direct communication with 'the rest of mankind." The ar rival of a "Lady" is duly chronicled. She is to take charge of an hotel iv the new city, which already boasts of its "Occidental." and "Lander Honse." The inhabitants are looking anxiously for the return of Dr. Veatch, who proposes to open an Assay office there, by which the miners of that re gion may be enabled to ascertain the value of their "feet" and "indications," without the tedious delays of formarding their sample specimens to Virginia City. The Dr. is one of the most reliable Assayers and Mineralogists we have among us, and appears to be held in high esteem by the pioneers of that distant milirg autpost, with the development of which he is most intimately connected. We have the promise of an article now and then from his per, for which the Dr. will

A Mining Transafton.-A miner from the mountaing stepped jnto the salesroom of one of our most wealthy merchants, about four weeks since, stated that he was "flat broke," and asked for $\$ 150$, offering to make over to the aforesaid merchant, a mining claim for the money. The merchant knew nothing of the man or his claim, but gave h:m the money and took his bill of sale. He thought no more of the transaction until a few days since, when a stranger called at his place of business and asked him if he was the owner of such a claim. Receiving an affirmative answer, the stranger offered him $\$ 4.000$ for the same. The merchant hesitated a moment when the stranger added another thousand to his offer. The merchant immedtately closed with his visitor and pocketed the cash without any forther remarks. The mer-
chant is still ignorant as to whether he sold a folly or a fortune.
The above paragraph, which we started a few weeks since, has gione the rounds of the press, sometimes credited,sometimes not. One of our mountain contemporaries, the $M \in s$ senger, at La Porte, intimates that we have drawn upon our imagination for the story. Not at all, friend Dewer. The only mistake we made was in naming the sum paid by the merchant-which should have read $\$ 500$ instead of $\$ 150$. We have now however, to add a little to the original story, to the effect that another offer of $\$ 8,000$ has been maide for the same ground. On further enquiry we are enabled to state that the "Merehant" can be seen every day in the weok (Sundays excepted) at No. 421 Clay St. The mining stock in question was 20 feet in the Antelope, at Eismeralda, which was quoted at the Stock Board in this city on the 6th of January last at $\$ 95$ per foot, and on the 2nd of March, at $\$ 400$. A little cyphering will satisfy any one that such a transaction as noticed above, might have been made, as indeed it really was.

A New Board of Brokers.-An association of brokers has lately been formed in this city, under the designation of The Stock Exchange, and they hold their first meeting today, for the transaction of business. The time of meeting is from $11 / 2$ to $21 / 2$ o'clock, p. M. Samuel Purdy is President; $^{\prime}$. Isaac Bluxome, Jr,, Vice-President ; M. G. Elmore, Secretary, and J. H. Bullard, 'Treasurer. There are now 30 members, and a number of applications have been made by others who propose to join them.
The orign of the Board, as we are informed, was in consequence of raising the price of membership admission in the Stock and Exchange Bpard. Their first entry-dues amounted to $\$ 100$, whicb were raised to $\$ 250$, and are now fixed at $\$ 500$. The entry-dues of membership to the new Board will be $\$ 100$.

Beneft Conoerv.-We notice, by posters, that Rising Sun Division, No. 1, S. of T. of this city, are to give a Benefit Concert, oit Dashaway Hall, Post St. on the 12th inst., the proceeds of which are to be appropriated to furnishing their Hall, corner of Clementina and First Sts. This is one of the most useful and energetic organizations of this description in the State. It is known, par exce!lence, as the "Literary Division." In addition to the usual exercises of such bodies, on alternate evenings of their weekly meetings the members engage in debates, and furnish written essays and compositions, which are embodied into what is called a "Paper." Some of these compositions we have seen, and can fully testify to their excellence. They may rank with first class magazine literature. These exercises are most beneficial, not only upnn the members themselves, but upon the entire community in which they move. Such an institution, made up almost exclusively of young men, and ladies, is eminently worthy of support and encouragement, and we trust their Benefit on Thursday Evening next, will be a Benefit indeed.

Weat next ?-A mine of Epsom Salts has been discovered somewhere on this Coast, but where we are unable to learn. The discoverer, however, is willing to incorporate for a reasonable consideration.

## OBITIUARY.

We regret to announce the death of James P. Cbenser, sod of Ricaard Chezart EsQ. of this city, who died, on Thursday last, at the residence of his Grandfather, Dr. Peck, at Northampton, Mass. aged 19., of a fever conracted in the Chickhominy swrmps.
We knew him well. He was always genorous, brave and kiod. A great favorite among his fellows, no party or game of ball was complete with-

## Review of the week ending february $28,1863$.

The preparations neccessarily consequent upon the municipal election
ichl took place in Virginia City an Monday last，exerted a somewhat de－ pressing infuence on stock operations in that market during the weels pre－ Fious．Although the amount of busiuess done was lgat，the rates，as a gen－ oral thing，were materially improved．We note adrauces as follows：
Union，Gold Fill district，advanced from $\$ 15$ on Tuesday，to $\$ 25$ on Thurs－ day，but declined again on Batarday to $\$ 22 \%$ ．This advance is attributable to hopes of success in the suit with the Yellow Jackot．Madison，wheh had remaind quiet for several weeks，fonnd sale on Wednesday at $\$ 18$ ；on
Thursday it advanced to $\$ 37 / 2 /$ where it appoars to reat quietly - holders firm．The advance in this stock is attributable to the fallure of the jury to agree in its suit with the Moseow．Beach \＆Paston has advancod from $\$ 50$ to $\$ 80$ ，with but little stock offering－holders lookjing for atill higher tig－ ures．Gov．Nye is also jn considerabie demand，and has advanced from $\$ 5$ to $\$ 6$ ，per foot，at which luttor．Agure it remains firm．Oriental has advanc
ed a dollar on a ahare，and is now quoted frm at $\$ 8$ ．Sacramento has mate－ rially improved and may be quoted at $\$ 70$ ，with but ittle in the market． This stuek is chiefy held in this city．Hawley，in Spring Yalley，which has been very quiet of late，is now agriu enquired for and quoted at from $\$ 15$
$@ \$ 20$ ．There has been considerable excitement turing the week in refor－ ence to the Bullion，growiug out of its suit with the Yollow Jacket．Quite a number of＂cards＂have been published，and holders on both sides are aervous．The ground in dispute is very valuable．Cousiderable exclte－
ment has been created in certain quarters with regard to the Irving，which is chielly held by one man－Wian，formorly of this city．Tho workmen up． on this ledge are reported to have struck very promising ore，and appearan－
ces indicate the upproach of a good vein．The priucipal holder is rating atock at figures varying from $\$ 26$ to $\$ 40$ por foot．Winn claime that the

Fing is ats extension of the Comstock vein．The iden is probably a barmlese fancy．If it should provo true，however，we should be compulted to admit that the ways of Nature are sometimes tortultous in the extreme．

## WASHOE STOCK REMARKE．

## ［Compiled hrom tur Dahi Teriturlal Eitbiprige．］

Teminay Enzang，Fubruary 24tb．
Thero has been less done in stocka to－day than promised yosterday，yet a number of sales are reported．Bulion buyers havo not been very abuada seliers，but the result has been no noticeable change in our yesterdays fig ures．It is firm at $\$ 45$ ，with little in the market．Sucramento is in request al our quotationg of yesterday．Ten feet suld to day at $\$ 65$ ．Zousye
 10；$\$ 12$ is usw with fow buyers．Uuion Gold fill，is sought for， 0 the \＄10；$\$ 12$ is usked with fow buyora．Union，Cold Hill，is sought for，and the amonnt of assessments paid－ 816 －is freely offered．Considerable is chang－ ing hatds．There is something dolug in Fairview at \＄16．Toxas is quiet． It may be quoted at $\$ 7$（a）8．Pench and Paxton is advancing，and may be此（30．Pride or Washoe is salcable al from $\$ .5$（920

Wednbaday Evenna，February 25th．
The demand for stocks has been lively to day，wlthough transfers have ot beou numerous．Builion is quiet．It may be quoted at $\$ \$ 0$＠$\$ 45$ ．Sac－ ramontu is stilt in request at $\$ 65$（c）$\$ 70$ ，although litte is in inarket at these figures．Oriental is fuding fiver，abd duriag the past two days，some 300 leet have changed hands at $\$ 4$（3）$\$ 5$ ．It is in good request to day at these agures．Hazel Green is saleablo at $\$ 3$ 任（a）$\$ 1$ ，to fill orders from below． Dunn is held stifly at $\$ 10$（as \＄12，with an upward toadency．Uuion，Gold Hill，is firm at $\$ 15$ ，with che demand considerably execeding the supply． Madison has been enquired for at low rates，and a fow feot found sale at $\$ 18$ $\$ 20$＠$\$ 25$ is offered，however，without accomodation．Zouave still in de mand at yeaterday＇s quotations，with＇but lithe in the market．Two or three south extensious of the Bullion，at Gold Hill，have boen located，and the mytherious Comstock，on which this clajm is supposed to be sttuated，ia be jug freshly traced to the southward by exports and theorists．

Thureday Evening，February 26th．
Operations in stocks have been neglected to a cousiderable extent to day a preparing for the municipal contest of Monday．Madison，owing to the inabulity of the jury to agree in its suit with the Moscow，advanced to－day from $\$ 20$ © $\$ \$ 0$ ，and its tendercy is still upward．Fifty or slaty feot chan ged bauds at $\$ 26$＠$\$ 37 \frac{1}{2}$ ．Nothing has been done in Bullion．Owing to the eard of the owaers of the Coppers \＆MHIH，reaouneing all elaim to the Bullion ledges，the stuck is exceedingly firm at $\$ 45$＠$\$ 50$ ．Union at Gold Hill，has been extensively purchased during tho week，aud is now com－ mauding a karge advance on provious quotations．It camnot be quoted a less thau $\$ 25$ ，although one or two small lots were sold to－day at lower Fates．Its hopes of success agrinst the Yollow Jacket seem to be strength ening．The ledge in dispute is of first class value．Gov．Nye is in request at from $\$ 6$（a）$\$ 7$ ，and is being largely monopoliztd for the purpose of speca－ lation，it la presumed．Oriental is enquired for at $\$ 43_{2}^{\prime}$（a）$\$ 5$ ，to fill order from below．With these exceptions we have no changes of moment to note from our last quotations．

Fribay Efrenvg，February 27th．
There has not been much done in stocks，to day，although the market is exceedingly active．Bullion is quiet．Ten foot sold at $\$ 42$ 有，fifteen at $\$ 45$ ， and ten as low as $\$ 38$ ．Union at Gold Hill，is still upward in the market， and is inquired for al $\$ 20$＠$\$ 25$ ，with little accomodation at these fgures The Yellow Jacket is also enquired for at an advance．The ledge in contro versy is one of tho best in the Territory．Beach and Paxton is moeting with considerable favorable comment．$\$ 50$ is offered for it，without takers． This cumpany bas fled its papers of iacorporation．Biadison is offured at \＄35 © 40，with little deaiing at these rates．Harrison has advanced a shade in consequence of the suit，and may be quoted at $\$ 6$（ $\%$ \＄7，for locator＇s t － tle．Very fair looking quartz is being taken from the Irving，and the prob ability of striking a ledge of value in that claim is brightening．Oriental is in request at an advauce of about $\$ 1$ on yesterday＇s quotations．

Saturday Eviming，February 28th，
Nothing of apecinl importance bas been dune in stocka to－day．Inquiry has been rife，however，and is quite equal to the demand．Little has been done in Bullion．The＂cards，＂pro and con，in circulation，have affected the prices to something of an extent，and buyers and sellers are dervous．It
may be quoted at $\$ 40$ ．Union，Gold Hill，has been dealt in to－day at our quotatious of yenterday． 40 feet chauged hands at $\$ 20$ to $\$ 253$ ．This atock shows indications of an advunce．Yellow Jacket can be sold ot $\$ 210 @ \$ 225$ for accepted title，but it is obtained with diffleulty in this market．Oriental is advancing，for some reason－proximity to a ledge，we are informed．It is $\$ 5 / 8 @ \$ 6$ ，with little disposition to sell at those iguras． Beach \＆Ruston is saleable ut $\$ 60$ ，with little or none th the market．Pey tona is ouquired for at $\$ 35$ ，Stsison is offered for $\$ 25$（a）$\$ 50$ ．There is little probabiy，be sold for $\$ 40$ ．Sadison is ofiered for $\$ 25$（a）\＄uo．There is little
doing in Geller or Lai Crosse． reported as having been sold at $\$ 15$（3）\＄20．Hazol Green has advance a shade in consequence of favorable indications．It may bequoted at．$\$ 4$.

## [continusd from 2nd page.]

if this was the case, the film was so small as not to be perceptible."

## |remoting ascalgam and cleaning out arrasters.

'Raspando" (scraping) is the name given to the operation of removing the amalgam of silver and gold from the arastres. It is done as follows. At the end of about every quarter, or sometimes only half-year, according to the quality of the ores being ground, after the arrastres have been diseharged, the workmen proceed to scrape all the stuff from the interstices between the stones forming the bottom, which they do with hooked pieces of iron. The staff removed is a mixture of coarse pieces of stones-are very finely ground-and amalgam of siiver and gold. If the arrastre be entirely worn out, the whole bottom is removed and everything well scraped and cleaned, when a new bottom is again put in.
That which has been collected from the bottom is next well washed by hand, in bowls, in a a tank filled with water. A certain portion of the stuff to be washed being placed in the bowl, there is then added a small portion of mercury for the parpose of collecting the finer particles of amalgam, and prevent them, as much as possible, from being washed avay by the water. The bowl is now moved about in the water in sucha way as will best favour the collection of the heavy amalgam and the removal of the lighter or earthy particles which are collected in the bottom of the tank, and is again washed on an inclined plain called a "Plamilla," so as to obtain as much as possible of the precious amalgam. Still, some of this is in such a fine state of division, from the long-continued action of the grinding stones, that much of it is lost even by the second washing, and no method has yet been invented by which the last traces of this finely divided portion can be aaved. The amalgam, after having been collected and cleaned, is freed from as much mercury as possible by being pressed in a leather bag; the dry amadgam is next burned (as we shall describe further on) to expel the remaining portion of the mercary, when an alloy of gold and silver remains. This is next removed to the Gorernment melting and assay office to be melted into bars and assayed, before being sent to the mint to be "parted." This alloy is termed "Plata mixta" (mixed silver.)

> LOSS OE GOLD.

By this method of grinding there is still a large loss of gold. From 25 to 33 per cent. on the assay may be taken as an average, and it is said by some to be as high as 40 per cent. The whole of this loss has never been satisfactorily accounted for; but there is always a certain portion washed away in the form of very fine amalgam in washing the stuff from the bottom of the arrastres. The silver obtained frum the treatment in the patio always contains a certain amount of gold, and the "Polvillos," which are the metallic portions - (principally sulphides of iron rich in silver) remaining from the wasking of a torta, always contain gold. These "Polvillos" are treated a second time to retain whatever gold and silver they may hold; but they will not yield them by the common method, without a preliminary operation. I think it quite probable that the gold may exist in these Polvillos as a sub-sulphide.

LOSS OF MERCURY IN THE ARRASTRES.
In many works which treat on this subject it is stated that it is only the native metals that are taken op or extracted in the arrastres, and the "Asogerros" (amalgamators) in general think that to amalgamate any quantity of the precious metals an equivolent weight of mercury must be sacrificed. It is, however, very evident that in the arrastres the mercary actually acts on the sulphide of silver, forming metallic silver and sulphide of mercary. Thie following gives the details of an actual result obtained in a reduction works at Guanaxuato. The amalgam added to the arrastre was 70 .nos., and was composed of 14 lbs . of silver and 56 Hbs of mercury :-

Additional mercury added during the whole time of grinding (exclusive of above)... .330 ibs .
Mercury in amalgam added..
"Plata mixta" (gold and silver) obtained, inclading the above 14 , $7 \mathrm{bs}, \ldots . . . .$.

Amalgam which ought to have been produced. . 470 Hbs . But there were only obtained 400 羊s., which was composed 84 tbs. of gold and silver (plata mixta) and 316 Hbs of mer-
cury; which, deducted from 386 , the total number of pounds added, leaves a loss of 70 Ibs. Now the alloy contained 18 Hos. of gold, which being in the metallic state in the ore would combine with the mercury without loss of the latter. Consequently, if we subtract this 18 lbs of gold from 84 ms . (the total alloy) there will remain 66 lbs . of silver. Thus we have a loss of as near as can be one pound of mercury for every pound of silver taken up (bearly equivalent proportions,) the difference being easily accounted for by mechanical loss in washing, barming, \&c. Again, the ores worked in Guanaxuato contain but little or no native silver, the gold only being in that form ; so that it can only be the slow reduetion of the sulphide of silver, that canses the loss. If the ores ground contain much native silver, then the loss of mercary will be lessin proportion: Or, it copper amalgam in place of that of silver be added to the arrastres at the commencement of the grinding, the copper will in a short time disappear, and the loss of mercury will be somewhat diminished.
singusar and interesting amalgamating process.
The reduction of sulphide of silver by mercury is a very curious fact, and one which I believe has been pointed out before. Still the following statements may be interesting. I took a small piece of pure red sulphide of silver and ground it dry in a clean porcelain mortar for about ten mioutes with a small portion of mercury. At the end of this time the mercury contained a considerable quantity of silver, which could only have come from the reduction of the sulphide. In conducting this experiment, it is curions to note that after having ground the two substances together for a few seconds, the whole of the sulphide of silver $a p$ parently disappeared, and the mercury had all the appear ance of being highly charged with silver (of amalgam) and spread itself in the form of a paste round the interior of the mortar; but on adding water to wash out what we thought was a pure amalgam, we were disappointed at finding the mercury again assuming the globular form, having only taken up a small purtion of the silver, whilst the re maining undecomposed sulphide of- silver mixed with the water. This circumstance, 1 think, can only be explained by the mencury actually dissolving the sulphide of silver, which apparently can only take place in the dry. tate.

```
[то uk costavem.]
```

Copper. Speclnens.-We acknowledge the reception of some rery fine specimens of copper ore-green carbonateshowing much native copper, from Mr. Geo. W. Hodakins, of Tayler's Ranch, (Indian Valley.) The lead is located about 14 miles from the Valley, and was discovered in June last. The company, known as the "Mountain Meadow Copper Mining $\mathrm{Co}_{\text {; }}$ " are now running a tnanel, which has already been driven 125 feet into the hill, for the parpose of thoroughly deyeloping the lead. The specimens before as are certainly indicitive of a very rich mine.

Gowd near Brookfield, Mass.-We clip the followiug from the-Hampshire Gazette; Mr. Trusdell, of Warren, has discovered something approximating to a gold mine, on the road between Warren and Brookfield. He has six or eight men engaged upon a veiu of rock, which somewhat resembles the quartz of California and contains some kind of ore. It is very hard and much heavier than ordinary rock. Very many people have been attracted to the spot; but, as Mr. Trusdell holds possession of the mine, if it be one, there is not much chance for others to stake off claims at present. Those at work upon the vein are confident they have struck a gold bed.

Treasure by tee Golden Age.-The amount of treasure shipped by the steamer Golden Age, Monday, was $\$ 872$, 30431 , consigned as follows :-
To England...
\$711,742 66
To New York.
154,561 65
To Panama. .
5,00000
Rich Ore.-Some rich speciniens of silver ore from the Sheba and Ben Franklin leads, Humboldt District, may be seen at the office of H, Critcher, Stockbroker, 211 Montgomery St., and at Mr. W. P. Denkla, 608 Montgomery St. at Kenney \& Alexander's Bookstore. They are a portion of the specimens alluded to in our Fiditorial notice of the Humboldt mines.

## Engravings, Electrotypes, etc.

We execute at this Omce Engravings and Iilustrations on wood, stone,
copper, steel, atc. Stzagotpysa and Eikctroming, Designa of every de copper, steel, otc. StzabotpysG and Eurcrapmng, Designs of every de.
scription-Buildings, sketches of Towne, Machivery, Stamp Dles, Sealh for Cription-Buildings, sketches of Towns, Machiwery, Stamp Dles, Sealh for Patrons will remember that when we execute engravings we will insert them free of charge in the MIMNGGAND Scienturc Prass, thus piving the advantagg of a Wide Circulation throughout the Pacific Coast in the beat Advertising Mfediano to be found inthe country.

## To Printers.

An Intersst in one of the most flourashing and best paying Neweps per Offces in the mountains is offored for sale on easy ma. A rare op portunity is hercby presented to any printer desirous of extablianing him self in a good business in one of the bealthiest, most thriving and delight ful mountain towns in the state. For further information enquire at this office.

Subscribe.-Are yon a miner and not a subscriber to the Mining and Sclentific Press? If so, you are an annual loser of many times the price of a year's subscription, particularly if you are engaged in quartz mining. The same amount of practial information, important to miners and mechanics, which is contained in a volume of the Press, cannot be bought from the shelves of any bookstore in the country for the price of several year's subscription. Do you ever send a paper to the "Old Folks at Home?" If so, and you desire to send important information and valuable reading matter, you can find no paper that will be read with so much eagerness by them, or one that will convey to them so full an account of the real industry of the country as the MINing and Scientific Press. We invite all to send us their bames and four dollars, or two dollars for six months, and become patrons of the only mining paper printed on the Pa cific coast. Those who receive a paper with this paragraph marked may understand that it is sent to them for examing tion, and with the hope that it may so for meet with their approval as to warrant their subscribing for it at once. It is not our usual custom to receive a subseriber for less than six months; but inasmuch as we are anxious to introduce the paper where it is not now known, we will, for the preaent, send the Press for three months even, on the recelpt of one dollar, in coic or stamps. It is our belief that no one will wish to discontue the paper after being a constant read er of it for even that short perioa.

## SUGGESTIONS ABOUT FOREIGN PATENTS.

American inventora should bear in mind that, as a general ale, any iovention which is valuable to the patentee in this country, is worth equally as much in England and some othor foreign countries. Four patents-American, Eoglish,French and Belgian-will secure an inventor exclusive monoply to his discovery among one hundred millions of the most intelligent people in the world.
The facilities of business and steam communication are sacb, that patents can be obtaived abroad almost as easy as at home. The majority of all patents taken out by Americans in foreign countries are obtained through the Mining and Scientific Press Patent Agency. Having established agencies at all the principal European seats of Govern-
ment, we obtain patents in Great Britain, France, Belgium, Prussia, Austria, Spain, etu., with promptness and dispatch.
Models are not required in any European country, but the atmost care and experience is necessary in the preparation of the specifications and drawingse
When parties intend to tak out foreign patents, engravings should not be published until the foreign applications bave been made.
Caution.-It has become a somewhat common practice for agents located in England to send out circulars soliciting the patronage of American inventors. We caution the latter against heeding such applications as they may otherwise fall into the bands of irresponsible parties, and thus be defrauded of their rights. It is much better for iaventors to entrust their cases to the care of a competent, reliable agent at nome.
While it is true of Most Enropean conntries that the sygem of examination is not so rigid as that practiced in this country, yet it is vastly important that inventors should have their papers prepared only by the most competent solicitors, in order that they may stand the test of a searching legal examination; as it is a common practice when a patentee finds parcbaser for his invention, for the latter to cause such examination to be made before he will except the title.
It is also very unsafe to intrast a valuable invention to any other than a solicitor of known integrity and ability. Inven tors should beware of epeculatore, Whetber in the guise of patent agents or patent brokers, as they cannot ordinarily bo trusted with valuable inventions.

Repalring of Naclinery promptly attended to. Repaling of Machinery promptly attended to.
No. 4 Sansome street, corner Marlet,

The accompanying engraving is a very correct and well executed illustration of "l'ond 8 Patent Quartz Crusuer," of which wo have hertofure made several notices. This is one of the most original conceptions in the line of quartz crushing machinery, which has ever been introduced to the pablic, since the first application of the origiual, ironbound wooden stamps. Mr. Pond has gone back to first principles and produced a machine, involving the most economical use of power, and combining at the same time simplicity and cheapnoss of construction, efficiency of action, compactness and lightness of metal, etc., which places it in most favorable contrast with anything of the kind heretofore introduced.
The production of this machine has not been the result of a casual thought, but of long contioued study and most diligent practice and experiment, The iaventor has had the advantage, in these experiments, of several years experience as a quartz miser, and a thorough practical education. He bas nearly worn out his original working model, which, as an xperiment, was but imperfectly constructed, in studying its principles, and testing, in the most thorough manner, every part and parcel of the machine, until he has at length produced one wherein he can devise no improvement, or discover any defect. We have watched with much interest the gradual development of the present machine, as piece by piece, it has come from the hands of the worknen, each part carefully studied and improved from the original model, until its completeness was reached, and the machine set in motion at the Miners' Foundry, in this city, where these machines are now being constructed. We should have given a full description of it at an earlier day, but we have been waiting for the accompaning illustration, by the aid of which wo might be able to give our readers a more clear understanding of the prineiples of the machine.

## tele illuetration.

The above illustration represents the machine with a portion of its side casing removed. When it is ready for operation it is closed as tightly as possible on all sides except on the right hand iu the engraving, marked J, where a screen of any required fineness is placed. When the rock is to be crushed dry, this screen, or rather that end of the machine is fitted into a tight box of any required dimensions, for receiving the pulverized quartz which finds its way through the meshes of the sereen in the shape of an impalpable powder:
$A \mathbb{A}$ is the bed plate upon which the machine is construct-

ed, $B$ being a movable die, fitted into the bed-plate, against which the hammers strike, as seen in the lower one in the engraving. To the shaft D is firmly fastened a massive center piece, $E$, which is cast with jaws or grooves for the arms F, F, F, F, they being held in their places by bolts as at L. The shanks of the hammers $\mathbf{H}, \boldsymbol{H}, \boldsymbol{H}, \mathrm{H}$, are held in their places hy hardened steel bolts at $G, G$, $G$, and so constructed that they can move backward after striking the die $B$, pass freely over it, and immediately by their centrifugal force fly out into position as represented in the engraving.
On the face of each Hammer is fastened a Shoe, I, made either of cast or wrought iron, or steel, and hardened. The Machino when running is entirely enclosed by the sides and rim The rock is fed into the Box, C , drops immediately in front of the Die, where it is crushed and carvied over on th the Screen, J, hy the motion and shape of the Hammers, where the fine material passes out, and the coarse returned in front of the Die, is again crushed and thrown over until it is all fine enough to pas̃s out througli the Screen, which may be of any required fineness.

The amount this Machine (four foot) will crush is from Tuelve to Tenty Twons per Day, depending upon the speed it runs and the power expended. The machine can be used either for Wel or Dry Work. For crushing Twelve Tons per Day it only requires Five Horse power. It is easily
kept in order; the wear and tear being a less cost per ton than in a Stamp Mill.

Great numbers of persons, expe rienced in quartz crushing, have witnessed the operution of this machine, and so far as we have heard, (and we have conversed upon the subject with many) all have expressed themselves most favorably impressed with regard to its working.
We understand that the machine will soon have a fair trial by the side ot one of the mammoth Mills on the Fremont (Mariposa) Es tate. Quartz Miners, visiting the city should not fail to call and examine this machine, as well asseveral improved descriptions of amalgamating pans, which are constantly in operation, every day, at the Minere' Foundry, on First street, where others are in course of construction.
These Machnss are so simple in the ir construction that any oue can put them together after they have been transported to the lo cality for which they are designed They are made in three sizes, as follows:
A 2-foot Machine rill erush from 2 to 3 tons; weight 1,000 lbs. cost $\$ 500$ A s-foot co " $\quad$ " 108 " " 8,500 lbs. cost 750 A 4 -foot $\quad$ " $\quad 12$ tu 20 " $\quad$ b 500 lbs cust 950 The 2 Foot size is for a Prospecting Machine; the other two sizes can be set up. at a mill for fifty dollars (exclusive of freight) ready to run.
Malitng Steel in Laree Masses.-Mr. Alfred Supre, of Paris has discovered, that by covering steel with bottle glass, or the slag of a charcoal smelting furnace, it may be melted in a reverbatory furvace easily and rapidly, and without losing any of its qualities-two tons may be melted at once in the same furbace. Although the furnace in which the expariments were tried was detective, it was found that in consequence of crucibles being dispensed with, and less fuel being required, a considerable economy was effected.
Thif Art af Printing.-A jubilee will soon take place in Vienna, in honor of the four hundred years existence of priuting in that city. The first Vienna pripter, Olrich Hann, opened his printiog office in 1432 , but did not succeed. and emigrated to Rome. He was the cause of the Emperor Frederic IV. bestowing a privilege on the printer, in the year 1468, which plaped them in equal rank with noblemen and scholars, and permitted them to wear a sword,
The London Rothschild has had a Carrara marble stair case put in his house al a cost of $\$ 150,000$

#  

THE MEXICAN METHOD OF AMALGAMATION.
BY JAMES NAPIER, JUN. F. C.'s.
Late Chemist and Assayer to the Guanaxuato Mint, Mexico.

## [COATLXED.]

The materials absolutely necessary for the reduction silver ores in the Patio are but few, namely-sulphate of copper, or magistriat, common salt,' 'chloride of solium and mercary. But the various modifications introduced have led to the employment of other ingredients, such as precipitated copper, copper amalgam, and fine amalgam.
1.-Magistral, or Sulphate of Copper.-This is manufactured from the sulphide of copper, mines of which exist in many parts of Mexico ; but the distict of Tepezela, about 18 or 20 leagues southeast of Zacateras, and about 65 from Guanasuato, perhaps sipplies the largest quantitities of this ore for the manufacture of the sulphate. The following shows the per centage of copper contained in Farious samples from this district :-

Copper per. cent.
$\left.\begin{array}{r}13.00 \\ 7.47 \\ 13.75 \\ 9.00 \\ 12.50 \\ 10.50 \\ 8.60 \\ 9.40 \\ 8.73\end{array}\right\}$

There are many much richer samples found in this local: ity, but these give a very fair idea of the class of ores generally sent to the various reduction works for the manufacture of the sulphate.
The sulphide of copper when brought to the haciendas is, Fike the silver ore, first reduced to a fine powder in the arrastres; but in grinding this, much more is charged to the arrastres at once, and they are discharged twice in the 24 hours. The ground ore is renioved from the arrastre to a small enclosure, where the water, with which it was ground, Is allowed to eraporate spontaneonsly, and where it is allowed to remain exposed to the air for a length of timesometimes two years-before being calcined. It is stated the Fonger it is exposed to the air, the more sulphate it will yield. I have examined various samples which had been exposed for a length of time for sulphates, but have never found any.
The furnaces in which this is calcined are called comalilios. They have a double hearth; the roof is almost quite flat; and the fire-place is in the centre, and runs longitudinally, so that the flame plays sideways. About eight arrobas of the ground ore (havirg previously had is few bandfulls of common zalt mixed with it) is charged cn each hearth. The fire is then gradually increased, and the ore kept almost constantly stirred for the space of from six to eight hours, when the doors and other openings are closed to exclude the air. When the whole is sufficiently cold to ensure no further calcination, the ore is drawn 1. through holes in the bottom of the furnace into a place , made for its reception.

The percentage of sulphate of copper obtained by this method of calcination depends very much on the care which .has been bestowed on the operation by the workmen. The following table gives the details of this operation as obtained in a few of the reduction works in $G$ uanaxuato.

| Name of <br> Haciendas, | Sulphates per cent. |  | $\left\{\begin{array}{c} \text { Total } \\ \text { por cent } \\ \text { of } \\ \text { sulphates } \\ \text { orsiled of } \end{array}\right.$ | Copper |  | $\left\{\begin{array}{c} \text { Ore } \\ \text { beffre } \\ \text { cal- } \\ \text { cining. } \end{array}\right.$ |

In this table I give the amount of sulphate of iron as well as of the copper, because it is certain that the salphate of iron also acts in the process of reduction, although not so perfectly as the sulphate of copper. A little of the copper given above as sulphate, will be in the state of chloride, formed by the decomposition of the small portion of salt added to the ore before calcination.

- In some districts sulphate of iron is mised with the sulphide of copper previons to calcination. By doing this, ores containing considerable quantities of carbonate and oxide of
copper may be used for the manufacture of magistral. The method employed by the amalgamators tó kuow good from bad magistral, or rather to know the strength of it, is very rude. They take a small portios of the calcined ore in the hand; then gradually immerse the hand in water, and from the intensity of the heat gireu out, they judge of the quantity of sulphate the sample is likely to contain, and how much will have to be used in the process of reduction.
They also like to employ the magistral as soon after calcination as possible, as by standing it absorbs moisture from the atmosphere, and a larger quantity is required.
All the sulphate of copper produced in the "apartado"* of the mint, from the precipitation of the sulphate of silver by copper plates, is used in the reduction works in place of calcined copper pyrites. In this case it is easy to calculate how much must be added to a tortc, and in using this torta is not augmented so much in bulk as when calcined pyrites is used.
2.-Sall.- There are various places io the Republic of Mexico where this article is obtained, but the principal localities are Peum blanco and Salinas. The former contains both salt lakes and springs; the latter were discovered by an English gentleman, Mr. Pollard, who was employed at this locality in extracting the salt from the earth (Salierra) of the lakes. The following analysis made at the Ecole des Itines, Paris, is of the falt earth from Penon blauco.
$\left.\begin{array}{l}\text { Chloride of Sodium...........19.00 } \\ \text { Sulphate of Soda..........20 }\end{array}\right\}$ soluble in water. Sulphate of Soda...
Carbonate of Lime Carbonate of Lime....... Carbonate of Magnesia.......... 1.60 Oxide of Iron.................... 1.80 Clay and Sand....................46.20
Water and Organic matier...... 7.60

## 100,000

This class of salt earth was formerly used without refining in the reduction works of Zacateeas, but the augm entation in the bulk of the tortas in consequence of so much having to be added for the purpose of obtaining the necessary amount of chloride of sodium, was very inconvenient, and its use has consequently been given up. The quantity of chloride of sodium contained in the purified salt from Penon blanco averages from 80 to 85 per cent., the rest being principally sulphate of soda.
In the district of Salinas the salt is also found in springs. Here English and German workmen are emploged to extract the sult, which they do by evaporation in large pans. The following are aualyses of sale from this district, and such as is sent to the various reduction works :-

|  |  | No. | No. | No. 3. | No. 4. |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Chloride of |  | 90.422 | 91.141 | 86.853 | . 623 |
|  | Magnesium | 2.520 | 2.538 | . 044 | . 008 |

|  | Lime |  |  |  |  |

The 100.000100 .00100 .000100 .000 The purest salt that is met with in Mexcio is sea salt, which I have found to contain, on various occasions, as much as 98.50 per cent. of chloride of sodium ; but the great cost of carriage of this salt from the coast to the interior, makes it too costly to be generally used in the reduction of silver ores.
3.-Mercury.-This metal, the consumption of which is very large. is almost entirely imported, although it exists in many localities in Mexico. I hare seen beautiful specimens of cinnabar-red sulphide of mercury-from Mazapil, and also from the Gigante near Guanaxuato, where some years ago a company was projected for the reduction of the ores; but works were never established, why Ido not know. However, considerable quantities of mercury have, from time to time, been obtained from these mines. The district of El Doctor, about 150 miles to the north of the city of Mexico, has also yielded a certain quantity of this metal.
4.-Lime.-This is not a necessary ingredient in the Patio amalgamation. It is only used when an excess of magistral has heen employed, and is then added in a caustic state, its object being to precipitate the excess of copper employed. Wood ashes are frequently added for this purpose instead of lime.
5.- Copper Precipitate.-In many of the reductior works this is used in preference to lime for counteracting the action of an excess of salphide of copper added to
torta, which it does by reducing the protochloride of copper to the state of subehloride. It is prepared by suspending s mercury bottle in a weak solution of sulphate of coppel when the copper is precipitated in the form of a very fint
powder." The use of copper precinitate in the Patio amal. powder. The use of copper precipitate in the Patio amal.
gamation was first proposed by Mr. Louckner, who also il conjunction with Mr. Henry Mackintosh, obtained a patentil Mexico for the use of Copper Amalgam in the tortas. The object of this was to save mercury; and if used skilfuly i no doubt would ; the patent, however, was evaded in man instances by using precipitated copper instead of amalgar The amalgam used by Messrs. Loukner and Mackintosil contained about 30 per cent. of copper. Finc amalgam also at times used with geod results.
treatment of tie groond ore (lana) in the patto to obtatn the silver.
The Palio is a large court yard well paved with flag carefully cemented together to prevent, as much as possibl the mercary passing between them. It is made on a sligl incline, so that superfluous water, froon rain; deć, inay rul off easily.
The ground ore from the arrastres is collected in a play called a cajete until it reaches a sufficient quantity to for a tortco or heap-which generally contains from 50 to montoues- 60 being the general size. The monton, howe er, varies in different places, as under-

| In Guanaxnato, a monton contains.... 32 quinatals.* |  |  |
| :---: | :---: | :---: |
| " Real del Moute |  |  |
| "Pachuca and Saco |  |  |
| "Zacatecas and Sombrerete |  |  |
| " Fresnillo |  |  |
| " Bolanos. |  |  |

When the necessary amount has been collected in the jete, it is removed to a space prepared for it in the body the Patio. This is an inclosure about 30 feet in diamet made by pil!ng two or three rafters on each other, and curing them in their place by large stones; the joints beir made good by horse-dung. The lama should not be mu more than a foot thick; for the thinnerit is, the quick will the operation of reduction go on. Here it is allow to remain till as much water evaporates from it as to lea rather a thin mud. This condition being arrived at, thess is added (which operation is called Ensabmorar) in the pi portion of from three to five per cent, on the weight of $t$ ore ; this, however, will deperd somewhat on the quality the salt used, and on the uature of the ores under treatme: but I now speak of salt such as that referred to in the an yses given. It is well known that those who use the salt, up to a certain point, will get out the silver in the shd est time. Some amalgamatora will never use more than per cent, salt; although they are quite aware the operati would be completed six or eight days sooner bad 5 per e been used ; but, the time gained will not compeusate for 1 extra salt used. My friend Don Juan B. Castelazo by mistake to a torta donble the quantity of salt necessa and the consequence was that the operation was conclu in ten days instead of about 25 -the usual time required ordinary ores.
When the requisite quantity of salt has been added, torta receives a repaso or treading (which will be descril further on.) It is then allowed to rest till the following $c$ when the whole of the salt ought to be in solution, thoroughly mixed with the lama.
Incorporar, (addition of Magistral and Mercury.)-] day after the salt has been added, they proceed (after bri ing the torta to a proper consistency with water, ) to add necessary quantity of magistral. If this be of an aver quality, for instance like that given in the preceeding ami ses, it is added in the proportion of from half to three-q ters per cent. on the ore, or about an arroba to each mor of ore in the torta. It is thrown as evenly as possible 1 the whole surface of the mass by means of wooden shor and when the whole has been added, the mules are admi to repassar-hread-for about an hour for the purpose mixing the whole as thoroughly as possible. When this a been completed, the morcary is then added in the propor of from $3 \frac{1}{2}$ to 4 fbs . to every mark (half pound), of

## TEEE ONLY MINING, MECHANICL AND SCIGNTLELO

 PAPER ON THEXS CONTINENT.THIRR YEAR: VOLUME NI--NEW SERITA I
A uew rolume of this extensively circulated paner commenced Sept. I1, A 8 . It is intended that every number bhall be repleto with information
concerning Miniag, scientife, Mechauical aud Industrial pursuits, together with several original engraviugs, of new inventions, otc., prepared expressly,
for its columns. for its columns.
This paper is devoted to the above purposes, together with the interestg
of Scieuce, Arts, Agriculture andi Commerce, and any general information of Scieuce, Arts, Agriculture andi Commerce, and any general information
thnt may be of interest to the reader : and it is the intention of the propriotor to spare no paius or expense in making it equal in interest and valuabie informution to any paper yet published.

## The Mining Interest ?

Will find it of great value, as it will contain all the news appertaining to' Mining, tho prices and sales of sining Slocks, new inventions of lachinery
addap ${ }^{+}$to that purpose, and of everything generally that may be of servics to the Miner.

## The Inventor!

Will find it an excellent medium for the purpose of bringing his invention Will find it an excellent medium for the purpose of bringing his invention
into notice, of ascertaining tho progress of invention in this and othor countrics, and also of receiving any information that may be pecessary in obtaining his patent, the proprictor haviug had great experience as a latent Agent, together with facilities at Washington thut enable him to ob
ain Patents with dispateh:

## The Mechanic and Manufacturer!

Will be greatly benefitted by its perual, as each number will contam soreral original engravings of new machines and iuveatoms, together with a large amount of reading mattor apper tiuning thereto- We are coastantly
receiving tho best scientific journals from all qumrters, from which wo
shnul continue to extract whatever may bo of benefit or interest to our shall cont
readers.
To Chemists; Architects, Millwrights and Farmers ! This journal will be invaluable. All new" discoveries in Chemistry will be given, and a large amount of information of grent servico to Architects and
Millwrights will bo fouvd in our columns. The Farmers and Plunters will not bo neglected, engravings will be given of agricultural implements, and
the farming jnterest generally will bo amply discussed.

## Terms.

To mall subscribers :-Four Dollars per annum.
Club Rates.
Five Copies for Six Months 88 ,
Ten Copies for Six Months, $\$ 16$.
Fifteen Copies for Twelve Months, $\$ 44$.
Twenty Copies for Twolve Months, $\$ 56$.
For all clubs of Twenty and over, the yearly subscription is only $\$ 280$ Names cau bo sent iu at different times apd from different Post-offices, Specimen copies will be sent gratis to any part of the country.

MRS. HALL'S VOLCANIC SMELTING FURNACE.
We would call the attention uf our readers to the subjoined "card" in reference to the above invention. The well known metallurgical and scientific attainments of the gentleman whose name is thereto affixed, must attach much interest and importance to the document.

By reference to an advertisement of the proprietress in another column, it will be seen that she is desirous of making arrangements with some person of means, to erect a trial furnace, capable of smelting one or more tons of ore. We trust that some one of the many capitalists, to - whom California has been generous, and who take an interest in the further development of her mineral resources, will come for ward and furnish Mrs. H. with the neans to give her invention a thorough, practical trial. Its success would lead to the most important $\mathbf{r}$ sults; while a failure, at the worst, would only involve the liss of a few hundred dollars in an attempt to solve a most interesting problem in practical metallurgy.

## San Francisco, Marce 14, 1863.

MADAME:-In accordance with your polite request to give you my unbiased opinion concerning your ingenious device of a fuel, metal, and labor-saving smelting furnace; I have to particularize matters in detail in order to be uuderstood, viz.:

The quadrangular dimen sion which you give your furnace outside, and the oval cavity for receiving the ore mixed up with crade lime and coals, is a contrivance well calculated to resist the inner pressure of the heat as well as to bring a considerable amount of ore into a very limited compass, to be acted upon by the intense heat thus concentrated and kept in this state up to the end of the process with a comparatively small consumption of fuel.

The moderate amount of steam, introduced by turns and the means of steam-pipes $g$ and $p$, is decomposed into its constitutive parts, viz.: oxygen and hydrogen, performing this way in part the functions of a hydro-oxygen blow-pipe ; the oxygen by its combining with the glewing coals augments their combustibility in a more rapid manner, and increases thus the intensity of the heat, which is still more augmented by the deflagrating hydrogen thus parted from the oxygen in the decomposed steam. Besides this change other decompositious and matual associations also take place in this mysterious furnace, viz : ores which are in an oxydated state, are thus forced, to give up their oxygen on the coals, which have a greater affinity for the same than any metal. By carbonates the intense heat volatizes the carbonic acid, and by sulphates the lime depriving them of their sulphur, and ormbining with it as gypsum, and thus the reduction of the ore into a metalic state being complete, the fire can now freely act upon the metalic particles of the ore, which thus liquified, sink by their specific gravity to the bottom of the above mentioned cavity of the furnace and are collected in pare slugs below the apertare $x$.

Another attribute of great utility in your invention is the Condenser C , with the sieve $\mathbf{0}$, which prevents the waste of any by the heat votalized mineral or metal to escape through the chimney, and is collected in said condenser.
This proces of reducing ores, is also a great deal accelerated by the abubdantly administered air, forced from all sides into the furnace, through the judicionsly dlstributed flues and draught holes, d, d, d, by which a great amount of oxygen, that indispensible requisite for the maintainance of the fire, is supplied with said atmospheric air, of which it forms a constituent part. If by the construction of your Smelting Furnace, on a large scale, said air flues could be put in such a position, as to conduct heated, instead of cold air into the furnace, the process would be considerably shortened and a still greater amount of fuel saved.

Having been a witness of your proceedure from its begin. ning to its ond, and seen the results of your labor, I am confident that your most clever device will revolutionise the old system of smelting ores, altogether.

Very Respectfuly,
Your Obed't Servant,
CHARLES HARASZTHY.
Mts. Eliza Jane Hall.
Treasore Regetprs.-The amount of treasure receipts, from the interior during the ten days interim between the sailing of the two last steamers was, within a fraction o $\$ 1,500,000$; an unusually large amount for the season.

VALUABLE DISCOVERIES IN THE RUSS DISTRICT.
Mr. R.S. Whinham of this city, who has recently returned from the Russ district, has shown us a letter raceived from that region a few days since, which gives an extended report of the success of a prospecting party which started out from the camp of the Ida company on Owen's river, Tulare county, on the eastern slope of the Sierra Nevada, and about 100 miles south of Esmeralda. The party consisted of six. They left camp on the 26 th of January, following the river in a north-easterly diriction about 15 miles where they commenced prospecting. The result of which was the discovery and location of the following leads ,-
The Jefferson, from 8 to 10 feet thich-argentiferous ga lena, galena in great abundance, rich in silver by assay.
Columbus-a gold bearing lead, in a granitic formation, from 20 to 30 inches thick-the lead rich, very friable, much decomposed, and abounds with fine gold in every part of it, as far as opened.
Chrysopolis, also gold-bearing, a well defined lead crop ping out for huodreds of feet in extent, and showing gold wherever examined. The lead is about three feet thick
Oro Fino-gold much resembling the Chry opolis, cropping out for many handred feet, and showing fine gold abundantly on the surface.
These are all parallel ledges within a mile and a half of each other, and all convenient to the river and most eligibly located for working. The company have taken up a mill site and contemplate early efforts toward developing these discoveries. Timber and water plenty. We note these discoveries, as indicative of the extent of the still unexplored region of country east of the Sierras. The prospectors assert that there are a plenty more veins still left equally and perhaps more valuable than those already located.
The developments daily being made in every part of the State and on both sides of the mountains, are bat cumulative evidence of the immensity of the yet uadeveloped minaral wealth of the Pacific Coast, and may s-rve to give us some faint idea of the future wealth and industrial proporrions which the golden State of California is destined to asssume at no distant day.

Local Mining Excitement.-It is said that some specimens, of silver ore have been picked up on California street, between Powell and Mason, which were taken out of the ledge of rock, now being dug away at that point in grading the street. Our "local" visited the locality but failed to discover any "ledge" or "indications" of silver. Those present stated that the "specimens" had all been taken away. According to the Morning Call, a quantitative assay made by Mr. Q L. Hagberg, No. 420 Montgonery street, for J. R. Sprout, one of the claimants, shows 1.29-100 ounces of silver and 1.21-100 ounces of gold to the ton, the total value of which is $\$ 38$ 32. This yield would not pay for working, but the company think if the outcroppings will pay even that much, better prospects may be developed by sinking a shaft, which will be done at once.
Somebody evidently has faith in the occurrence of silver ore at that locality, as a regular Stock Company has been formed, and the certificate of incorporation filled with the County Clerk. The ground claimed by the Company con sists of the consolidated claims of a number of parties. The locality, beyond the limits of the street which belongs to the city, is all owned by private individuals, whose title will have to be purchased before any operations beyond "staking off" can be commenced.
Quick Wort.-The Sonora, on her last trip to this city remained in port but 24 hours, during which time she discharged her large inward cargo, with passengers, baggage etc., and took on board 400 tons of coal for the down trip, and the ships stores necessary for the voyage, together with a full list of passengers. This is a degree of dispatch which we think must be without a parallel, and speaks well for the energy and system with which everything connected with this company is managed.

T're Moses Taylor sailed promptly to her advertised hour, on the 11th instant, with an unusually large list of passengers. This boat has been put in the most perfect order throughout, and her passengers will doubtles have a most pleasant and speedy trip to the Isthmus, on their journey homeward.

## COPPER SMETITING WORES.

A company of San Francisco capitalists, has recently been incorporated with the view of erecting works for the reduction of copper ores on this coast. The company has purchased a fract of land about two miles above the junction of the Sacramento and San Joaquin rivers, upon the South bank of the latter. Among the names of the corporators we notice some of our wealthiest and most enterprising citizens. The point selected for the works of the company is a most judicious one. It is within five miles of the Mount Diablo coal mines, and directly on the route which all the ores of the region drained by tbe Sacramento and San Joaquin rivers must take in reaching a market.

The company will probably put up but a siogle furnace to commence, which will bequite sufficient to thoroughly test the practicability of the project. The works will be erected and placed in operation under the general supervision of Mr. Price, a gentleman intimately acquainted with all the details of this intricate branch of busioess. Mr. Price will bring to the aid of the company the accumulated ex perience, which for many jears has been in process of aggregation at Swansea, England, where this business has been reduced to as perfect a system and as closely economised as is practicable, at the present period of metallurgical knowledge.
Every element of success attainable on the Pacific Coast has been secured with the riew to make the enterprise remanerative, if possible. The public spirited gentlemen who are advancing the capital for this operation are governed more by a desire to test the practicability of reduction works on this coast, than by a mere desire to realise a large percentage on their investment. Should success attend the effort, it will add a renewed impetus to our copper mining interest, and give value to a large proportion of ores now worthless in this market. The Company, at present, will limit their operations to a reduction of the ores to "regulus" and will not undertake any refining process antil the preliminary one has resulted in success.

The shipment of treasure per Sonora was as follows:To England.
$\$ 380,16464$
237,72804
To New York 5,00000

Previously this year.
Total since Janutry 1st, 1863. \$ 622,89268 Corresponding period of 1862 . $811,321,66227$
$7,376,17910$

Excess this year. $\$ 3,945,48317$

Mining Intelifigence.-Several of our eity cotemporaries speaking of the Copper Smelting Works about to be erected near the junction of the Sacramento and San Joaquin rivere remarks that their proximity to the Mount Diablo Coal Mines will give "the new works a great advantage over those at Swansea and other places where the coal has to be procured at a great expense from abrcad."
Our contemporary, we apprehend, is not thoroughly posted. Instead of an anvantage to be derived from the near proximity of "the New Works" to coal, their distanee from that important material, and the great comparative cost of providing the same, will be found the chief obstacle to be encountered in making these works pay. The smelt ing works at Swansea, are located directly at the mouth the coal mines, and nearly all the coal used in the furnaces are the screenings which are unmeachantable, and would no pay for hauling to a market. Notwithstanding the disad vantages under which these works will go into operation, nevertheless trust and believe, with our cutemporary th "this enterprise which is expected to be in successful opere tion within the next two months, will prove of great benefi to the copper mining interests of California.
"Tee Stock Exchange Board."-The new Stock E change Association held their first meeting on Monday las at their rooms in Montgomery Block, and the following off cers were elected: President, A. P. Sandford; Vice Presi dent, M. Livingston ; Secretary, James H. Gager; Treas urer, T. D. Mattherson. There were 40 members preseni
There is a scheme to construct another tunnel unde the Alps, the point being settled at the Simplon. The tc tal length of the proposed tannel will be about 4506 metres

stock remarks.

## SAN FRANOISCO, March 16th, 1868.

The Mining Market for the past week has boon decidedly dull. Transae tions bave been cumparatively light, first and second class stocks have gen erally dectined. Stocks of lower grade have beld firm to last week's qnotations, and some have advanced. Mauy buyers have concinded, before investigg further, to virit the mines and examine progress. Some have al ready gone, others are waiting for improved roads and more settled woather. Capital, for iegitimate opeartions, is as abundant as ever, but there is cauthan than heretofore, and to rely more upon personal knowledge and inspectiou of the mincs. Wo subjoin the transactions of the week.

There is a large quantity of Humboldt stock in the Virgioiu market, Iow rates; but it is dealt in spariogly, and generally at private rates. Reese River seems to be altracting attention at the present timo proference to Humboldt.

## WASHOE STOCK REMARES.

[Comphed from time Daily Terrbtoraal Entereprise.]
Monday Evenifg, Mar. 2nd.
The election to-day has interfered somewhat with the stock trade, and fome specimens of the recently discovered quartz in that section. One ledge, upon which a number of locations bave been made, crops out a three or four points during a distance of as many miles, and is apparently forty or fifty feet in thickness. The quartz presents nothing to the eye but antimony, but assay shows silver and gold as well. The locality is some forty or forty-Ave miles north of Virginta. When the informant of the En terprise left Peavine, about iwo hundred prospectors had arrived; and
something of an excitement was brewing. The people of Dayton are also something of an excitemenly was rewing. The people or Dayton are also parallol with each other, about six males from that place. The cropping are ovor one hundred feet in height, and assays from them aave showa the neighborhood of $\$ 100$ in gold and siver to The tov. Sbere is quite stampedo in that direction, we are informed. There has been a light in-
quiry to-day for Rirdsall, at $\$ 20$; for Union, of Gold Hill, at $\$ 25$; for Beach and Paxton, at $\$ 65$ @ 70; for Oriontal, at $\$ 8$ @ 9 ; for Fairview, at $15 @ 17$ for Zouave at \$17 © 18.

## Tuksday Evening, March 3d

Transactions to-day have not beon numerons or very important. The
Recse River mines have been a prominent topic, owing to a large yiela Reese River mines have been a prominent topie, owing to a large yiela
from the Bive Ridge, in that section. Fleven huarlred pounds of ore profrom the Blue Ridge, in that section. Fleven hutrlred pounds of ore pro
duced the astonishing result of $\$ 1,136$ ju silver. The bar of bullion is on exhbition at Light's Exchange, as well as some specimons of the ore Some fifty feet of that ledge were offered at $\$ 25$ por foot, $\$ 20$ was bic
There bas been some action in Union, Gold Hill, to day. Sixty feet sold a $\$ 25,15$ feet at $\$ 2750$, and 12 fect at $\$ 30$. Zouave has been in request, to fill orders from below. Forty feet sold at $\$ 18$, and 36 feet at $\$ 20$. Birdsal has been dealt in at $\$ 20$ This stock, owing to the near approach or the shaf now being sunk to the ledge, is getting jato request. Bullion can be had quiet, can be sold at $\$ 75$ @ 80, with little in markot. Burbside is inactive at a shade below being exhibited from che Irving. Fairview can bo \&old at \$16 © $\$ 17$ (a) 18 , but noue changing hands. Beach \& Paxton is athl upward, but as th cl im is small, it is obtained with difliculty. An immonse body of ore o
moderato vulue is exbibited. We quote itat $\$ 75$ (@) 80 , although there i none in market at these figures. Texas and Oriental are firm at $\$ 8$ (c) 10

## Transactions have been limited, with no especial demand for anything

Gold Hill shares of all kinds aro meating with favor. Doion io in large demandat $\$ 25$ @ 30. Eureka, recently locorporated, is saleable at $\$ 20$. Buchadan is ratiug at $\$ 76$ (3) 100. Bullion remains at our quotations or yeaterday, with nowe ofluring. Fairview ranges from $\$ 15$ (6) 17. Yolo can bo had for $\$ 10$ © 12 . Sinaloa may bo quoted at $\$ 0$ (1) 10. Zouave has been lighty figquired for at $\$ 18$ (a) 20. Sixteen feot sold at \$18. Beach \& Paxtan can be soldat $\$ 100$. Holders aro aekiug $\$ 500$. With so wide a gulr between buyers and sellers, wo cannot hope lo report maby transactions fa thia stock withle the next thirty days. Birdsalf is saleable at $\$ 20$, in amall lota Twenty feet sold at these gigures. Oriontal in markotable at $\$ 7$ (1) 8, Sixat $\$ 8$.

The atock trade has beon remart Thursday Evzange, March 5th.
ben confin to invest dled bastily and without discretion in some instances ; but a return of the freozy of '60 is not anticipated. The impalience of enpital, however, seems to increase with tho supply, and during the coming Summer mere or less imprudence in inveating may reasonably be looked for. There hes been a light demand for Zouave at $\$ 10$ (3) 20 , and somo 40 shares have beea rrausferred at these agures. This stock in finding its way into the hands of heavy operators at the Ray. The Pioneer, in this distriet, has been deast in
to nome exteut to day, and a number of reet changed hunds at $\$ 0$ @ 10 . to nome exteut to-day, and a number of reet changed hands at $80 @ 10$.
We know nothing of its merits. The ledge claimed is immediately west of tho Virgiala. Birdsull has been marketable to-day at 20. Twonty-five foet changed hands. There are buyers of Unive, Gold Hill, at $\$ 2750$ (a) $\$ 30$. Twenty-five feet were sold at the former figures. Adriatic fand Harribon, Flowery District, are in request at low rates ; $\$ 3$ is offered for the first and $\$ 3$ (1) 4 for the latter

Friday Evenina, March bth.
The business of the week presents a handsome aggregate of sales, and a general advance of stocka is observable. Moscow has been one of the themes of the day. Yesterday, $\$ 200$ and $\$ 225$ were paid, and the impression prevailed that the stock would advance to $\$ 500$ before the close of the week. This expectation bas not been realized. We have beard of no oflor above $\$ 200$ to-day. The North Ophir prodigy has ougrossed some attention. The assays are certanly large, and well calculated to excite; but the extort of the pay streak is a question uizon which there is a voy deided cos aict of opinion. Some who have viaited the claim venture to express an
emphaticalyy unfavorable opinion of ita merits. It has been offored to-any at $\$ 20$ per foot, whithout buyers. The Yellow Jacket has advanced to $\$ 350$ @ 3500 -attributable almost entirely to favorable developments. Were it
free of dlapute-the Union also claiming tho ledge-it would reach $\$ 1000$ per font in loss than 30 days. Bullion, Burnside and Milton are inactive, and we have ne transtctions in either to report. Birdsall is selling in small lots at $\$ 20$ @ 2250 , and 40 feet changed handa to-day at these Ggures. Texas is salenble at $\$ 7$ @ 8 . 10 feet sold at $\$ 750$. Beach and Paxton can be sold readily. 10 feet found a purchasor to-day at $\$ 118$ per share. Grass Valley is in demand at $\$ 8$ (a) 10, and $\$ 12$, It is reported, has been paid. Thia old title is being brought up by the owneas of ground which it is supposed to cover. Flowery stocks are ou the advavec. Adriatic is saleable at $\$ 15$ (a3) 20, and Harrison can be sold at twice its former rates,

Our Seturday's report has not come to hand.
The only chauges we notice in Monday's report, of previous quotations, is an adrance of El Dorado from $\$ 50$ to $\$ 60$, and Union, Gold Hill, from $\$ 35$ to $\$ 40$. Yellow Jacket is still fmproving-five feet sold on Monday for $\$ 400$ per foot.

Of the sales during the weok, the following only, were submitted for pub
150 feet Bodie Bluff Consolidation, on private terms.
5 feet Bodie Silver Hill Consolidation, terms private.
25 shares Gon. Hooker Consolidation for $\$ 260$

## ORITYUARY.

We regret to announce the denth of Jambs $P$. Cmenerx, son of Riolard Caenery Esq. of this city, who died, on the 5 th inst., at the realdence of ar Grandfather, Dr. Peck, at Northampton, Mass, aged 19., of a fever contracted in tho Chickahominy swamps.
We knew him well. Fo was always generous, brave and kind. A great favorite among his fellows, no party or game of ball was complete withfavorite am
out Jmary.

## [CONTINTER FROM 2nd PAGR.]

contained in the torta. This mercury is introducedina very fine shower, by being pressed through a linen sheet so as to divide the particles as much as possible. The torta, when the mercury is added, should not be too wet, otherwise the mercury would be apt to collect into large globules again -neither should it be too dry, as the mercury in that case would become too much divided, and thus cause "a larger loss than necessary in washing*-it should be of such a consisteocy, that the animals can, in treading, go through it with comparative ease, and yet leave the marks of their feet when removed. Immediately after the addition of the mercary the whole is again trodien for about four or five hours for the purpose of incorporating as perfectly as possible the whole mass.

When pure crystallized sulphate of copper is employed, instead of common calcined pyrites, there is added from 10 to 14 Ibs . for each monton of ore in the torta.

When the magistral and mercury have been added, and a repaso given, the torta may be sald to be in working order; and it only remalns for the azoguero or amalgamator to watch attentively its daily progress by repeatedly taking out tentaduras, samples:-the colour and general appearance of the mercury being the only guide to the whole operation.

A short time after the incorparo, the azoguero takes ont a tentadura from the torta; washes away the earthy particles, and carefully examines what remains, which is composed of polvillos-metallic sulphides-and mercury. If the latter be rubbed with the thumb, or pressed through a piece of leather, but very little amalgam will remain. The colour of the mercury, in this case, is only taken notice of ; and if it has altered a little from its natural colour, with a slight tinge of yellow, it is sign that sufficient magistral has not been added; or if the mercury be divided into small particles it is a similar sign. If it partakes of a lead or deep grey colour, it is evident that an excess of magistral has been added, and the torta, in such a state, is said to be ca-liente-hot-which is very prejudicial, and causes an unnecessary loss of mercury. . For this reason it is always betler to err in adding too little than too much magistral. If the right quantity required be put upon it at first, it is a great object gained, as the torta at once falls into good working order and goes on, barring unforeseen accidents, with but little trouble to the end of the operation. When a torta is in good workiug order, the surface of the mercury is of a distinct light grey colour.
[TO be contriekd.]

The Ruling Passion.-The local of the Amador Ledger, who has become very much excited with regard to the recent wonderful copper developments in that neighborhood, undertook to describe one of the beautiful mornings of the past week, and let himself off as follows:-
"On Thursday morning last the sun 'cropped out' beautifully, giving 'good indications' of a fine day", etc.

## A STOCK BOARD IN VIRGINIA CITY.

The brokers of Virginia City have organized a Stock Board, adopted a constitution and code of by-laws and elected the following offcers for the first term :-

$$
\begin{aligned}
& \text { A. C. Wightman, . . . . . . . . . . . President, } \\
& \text { Jackson Mokinstrx, ...... Vice } \\
& \text { John McCarthy, . . . . . . . . . Secretary, } \\
& \text { W. R. Scribner, . . . . . . . . Treasurer. }
\end{aligned}
$$

Their first meeting for business was held on Monday last Regular daily meetings will be held and publication of the doings thereof made through the newspapers.

Anothet Ophir.-The denizens of Virginia City have recently been terribly excited about a wonderfully rich discovery in the "North Oylir," (Argentine District) a lead iocated and being worked on the Ophir grade, about a mile and a half from the Summit House. It is described as being 50 feet wide and of great richness. It has been opened about 30 feet below the surface-mostly gold, some silver. The Enterprise says that one and a-half feet of Savage have been given for ten feet of the new Ophia-equal to about $\$ 20$ per foot; 1600 feet in the claim.

Mining Directory.- We have in course of preparation a "Minging Directory," whereir. will appear, in tabular form, all the Incorporated Mining Companies, which Thave offices in this city, the names of their Secretaries, place of office, location of mine, etc., etc. This table will be corrected month ly, and will prove of great convenience to the public: We had intended to lave had it ready for this issue, but it is unavoidably postponed until next week.

Subscribe.-Are you a miner and not a subscriber to the Mining and Scienttife Press? If so, you are an annual loser of many times the price of \& year's subscription, particularly if you are engaged in quartz mining. The same amount of practical information; important to miners and mechanics, which is contained in a volume of the Press, cannot be bought from the shelves of any bookstore in the country for the price of several year's subscription. Do you ever send a paper to the "Old Folks at Home?" If so, and you desire to send important information and valuable reading matter, you can find no paper that will be read with so much eagerness by them, or oue that will convey to them so full an account of the real industry of the country as the Mining and Scientritc Press. We invite all to send us their names and four dollars, or twoo dollars for six months, and become patrous of the only mining paper printed on the Pa cific coast. Those who receive a paper with this paragraph marked may understand that it is sent to then for examination, and with the lope that it may so for meet with their approval as to wurrant their subscribing for it at once. It is not our usual custom to receive a subseriber for less than six months; but inasmuch as we are anxious to introduce the paper where it is not now known, we will, for the present, send the Press for three months even, on the recelpt of one dollar, in coin or stamps. It is our belief that no one will wish to discontue the paper after being a constant reader of it for even that short period.

## SUGGESTIUNS ABOUT FOREIGN PATENTS.

American inventors should bear in mind that, as a general rule, any invention which is valuable to the patentee in this country, is worth equally as much in England and some other foreign conatries. Four patents-American, English,French and Belgian-will secure an inventor exclusipe monoply to his discovery among one haudred millions of the most intelligent people is the world.
The facilities of busiaess and steam communication are such, that patents can be obtained abroad almost as easy as at home. The majority of all patents taken out by Americans in foreign countries are obtained tbrough the Mining and Scientific Press Patent Agency. Having established agencies at all the principal European seats of Government, we obtain patents in Great Britain, France, Belgium, Prussia, Austria, Spain, etc., with promptuess and dispatch.
Models are not required in any Furopean country, but the utmost care and experience is necessary in the preparation of the specifications and drawingse
When parties intend to tak out foreign patents, engravings should not be published until the foreign applications have been made.
Caution.- It has become a somewhat common practice for agents located in England to send out circulars soliciting the patronage of American inventors. We caution the latter against heeding such applications as they may otherwise fall into the hands of irresponsible parties, and thus be defrauded of their rights. It is much better for inventors to entrast their cases to the care of a competent, reliable agent at bome.
While it is true of Most European conntries that the system of examination is not so rigid as that practiced in this country, yet it is vastly important that inventors should have their papers prepared only by the most competent solicitors, in order that they may stadd the test of a searching legal examination; as it is a common practice when a patentee fiuds a purchaser for his invention, for the latter to cause such examination to be made before be will except the title.
It is also very unsafe to intrust a valuable invention to any other than a solicitor of known integrity and ability. Inventors should beware of speculators, whether in the guise of
palent agents or patent brokers, as they cannot ordinarily be patent agents or patent brokers, as
trasted with valuable inventions.

THE MEXICAN METHOD OF AMALGAMATION.

> BY JAMES NAPIER, JUN., F. C. S.

Late Cbemist and Assayer to the Guanaxuato Mint, Mexico.

## [contwurd.]

The day after the incorparo (should the magistral have been added in proper proportion, a very different appearance is presented in the tentadura. There is found collected mercury which when pressed by the thumb yields amalgam of silver ; and what is in the first trial desecho-broken up mercury-appears now as what is termed limadura de plata, of a whitish colour, and in the form of thin plates or leaves which, if rubbed with the thumb, will be found to consist of dry silver amalgam called pasillc. It is from the appearance of this that it is known when the operation is going on well. It pasilla be formed in a very short time after the ingredients have been added, it as certain they have been added in proper proportions.

I'o make a tentadura, about 1 Fb . of the lama taken firom various parts of the torta, is put into a jicara aud slowly washed in water contained in a convenient vessel. The jicara is gently moved about in a peculiar manner so that the lighter part only is washed away, leaving in the jicara the limudura de platu, (small leaves of amalgam;) the mercury with its lista, or tail; and a portion of the polvillos, or heavier metallic sulphides of iron, \&c. There is now added to the jicara about a tea-cup full of clean water; when it is inclined to one side in the hand, and a gentle but peculiar movement given to the water so as to arrange the contents of the jicara in the following order :- The limadura or broKen up lis of mercury should occupy the first or upper part; the metalic portion of the ore should be below this ; and, last of all, the mercury and amalgam as a large globule. As I have stated before, the limadura is the most important part, and is inspected first; this is done by holding the jicara in the right hand in an inclined position, and rubbing the limadura with the thumb of the left hand, at the same time observing with great care its colour-the facility with which it can be converted into amalgam by the friction-and of the consistency of the resulting amalgam, that is to say, whether it contains a large or a small amount of mercury. The metalic portion, or povillos, is not of muca importance, as the state of the amalgamation cannot be judged of from it. The globule of mercury at the bottom is lastly examined as to the colour, and the quantity of amalgam which it contains is ascertained by pressing it with the thumb on the side of the jicara.

Tbese tentaduras are commonly taken from the surface and interior of the torta. The surface is a.waya the most forward from its being most exposed to the action of the air and sun. Three tentaduras, or trials, are made of each tor ta daily; one in the morning before commencing to tread; one after it has been trodden for some time; and a third after the treading is finished.

When the operation approaches conclusion, that is to say, when nearly the whole of the silver capable of being taken up has been extracted, the limadura becomes weak, and upon being rubbed with the thumb shows but little amalgam. When it ceases to do so altogether, feels soft, and combines into small globules which run down to the bottom of the jicara, the amalgamation may be considered finished or vendido. Howeven in some cases, a torta may show the signs in this respect of being finished, when in reality it is not; for this reason, the asciento, (metallic portion, or polvillos, remaining in the bottom of the jicara,) is also examined by extending it out over the jicara, and rubbing the small prills collected there with the finger. If these unite into running mercury, then there is no doubt about the operation being finished; but should they form dry amalgam, it is not so, and the operation must be continued until such is the case.

If the benefico (amalgamation) be low or cold, these signs are deceptive; consequently it is better to carry the torta rather hot than culd. At the present day the amalga mators, besides being guided by the above signs, also make an assay of the torta, by taking as average a sample as possible from the heap-washing it and collecting the whole of the mercury and amalgam, and having it assayed. By this means it can be easily calculated how much silver the whole of the mercury present ought to contain.

Treading; and turning over the Torta.-The operation
of treading is crried on almost exclusively hy mules or put in, and the operation continued in a similar manner till h.rses; and it is repeated every other day until the end of the whole torta has been washed.

The operation. One mule to every two montones* is about
the number employed. They are tied together four abreast, the number employed. They are tied together four abreast,
and blinded, and a man stands in the centre of the torta, holding a halter attached to the animals to guide and direct them through the mass. They first commence to tread at the edge or border of the torta, and very gradually worl into the centre, which ensures the whole mass being thoroughly trodden. The operation lasts from about 6 o'clock in the morning till about 1 or 2 in the afternoon. Besides this treading, the tortas are also turned over twice a week by men, by means of wooden shoyels. This is done on one of the days of the treading, and is commenced immediately on the removal of the animals from the tortas.
Animals are kept exclusively for the purpose of treading ; and very frequently, when they hecome old and die, a ball of amalgam, weighing at times many ounces, is found in their stomachs. This is easily acconuted for, for when they come from sutarta they often commence to lick themselves, probably for the salt which may adhere to their bodies, to which also a considerable quantity of very finely divided amalgam may have attached itself. This latter pasees into the stomach where, in the cour-e of years, it accumulates into a large piece. I hese pieces of amalgam are extremely heavy and solid, and vary in size from a small nut to a large egg. The animals, as soon as they have finished treading, are well washed in a large tank of water.
It is believed by many that no means of repaso or treading, except that of avimals, can be effectual, the reason assigned being that animals have the power of imparting or exciting a slight electrical action in the mass. This, however, has been entirely disproved by some amalgamators using machines in place of animals, and obtaining equaly good results. I have no doubt machines will, before long, be entirely used, instead of animals, for this purpose.

Washing-W here the amalgation is con-idered complete, some amalgamators, previous to washing the torta, add to it a portion of fresh mercury which is called bano-bath-for the purpose of collecting as much as possible the finely divided amalgam. However, others prefer using a larger quantity of mercury in the torta, from the commencement and adding no bano. The next thing to be done is to separate the amalgam from the vast amount of earthy matter with which it is associated, which is done as follows, in most of the well couducted works:-There are arranged in a shedlavadero or washing-house-three large round tanks, built close together in a circle, and communicating with each other by means of an oblong opening about 13 inches high and $81 / 2$ inches wide, commencing at about a foot from the bottom, and terminating at about the same distance, or a little more, from the top. These tanks-tinas-are built of stoneslabs, which have to be carefully cemented together, particularly those at the bottom, as much of the mercury might be lost. In the ceutre of each tank there is an upright shaft, carrying four cross arms, to which are attached long wooden teeth or stirrers, the whole being moved by one mule. The pinions which move the agitators of the second and third tank are a little larger than that attached to the first, so as to give them rather a slower motion. The tank into which the metallic mud is first thrown is called la tina cor-gadora-(the changing tank)-and the last one the descargadora or discharger. The torta, before being washed, is divided into a certain number of parts; each part, before being taken to the washing-room, being softened with water and a treading. A given portion-which is measured by large wooden bowls - of the lama is thrown into the first tank (cargadora,) water being allowed to run in and the machinery being made to revolve rapidly (the driving mule going at a gallop) at the time of changing, so as to break up and separate the whole mass as much as possible. Little by little the mule is made to go gradually slower and slower, till at last it only moves at a gentle walk : the mules being specially trained to the different paces required. From time to time the azoguero removes a portion of the slime under treatment, and washes it in a jicara:-from the amount of mercury remaining at the bottom-which at last ought to be a mere trace-it is judged when the water holding the earthy particles in suspension may be run off. This is done by opening a large plug near the bottom of the last tank-des-

Besides the fluid araalgam which remains at the bottom of the tina, there is also a quantity of the heavier portions of the ore-cabetilla-which is very rich in amalgam. This is removod in wooden bowls to a tank-pila apuradoraand thrown intu a large bowl called a batea apuradora; these vary from three to five feet in diameter, and float on the surface of the water. The person who manages this batea leans over the side of the pila, and with a hand on each side of the batea manages to give a peculiar shaking or rocking motion, at the same time constanily dipping up a small quantity of water, which he washes round the batea and then throws out, carrying with it a portion of the cabezilla.
This is repeated till there is collected from 20 to 30 lbs . of pella-amalgan--which is carritd to the azogueria (mercury house,) where it is deposited in a large stone trough. When the whole of the amalgam from a torta, or as much as the trough will conveniently hold, has been collected, a large quantity of pure mercury is added, and also a gallon or two of water. Two men next thrust their right arms into tho amalgam and stir it about in every possible direction for some time, for the purpose of cleaniug it as much as possible. Every now and again the matter which collects on the surface is removed, as is also the water, and the operation repeated time after time until the surface of the a malgam presents a a bright smooth surface, when it is very carefully wiped with a woolen cloth.
Pressing Amalgam or Pella.-When the amalgam has been properly cleaned as above, it is removed iuto a coneshaped bag-manga-made of sail-cloth with an outer coveriug of leather on the sides. This manga is hung from a beam, and the exce:s of mercury filters through the canvas bottom into a trough beneath it. The amalgam is allowed to remain in the bag, as a general rule, about two hours, when it is emptied out on to a table. It now presents the appearance of very fine sand ; and in this state is next beaten into iron moulds, and formed into bricks-bollos-of about three or four inches thick, and wedged-shaped, so that when six of them are placed together they form a circle, leaving a round hole in the centre for mercurial vapours to pass through in the next operation.
Burning.-The final operation is to expel the last traces of mercury from the silver, which is done under a large copper bell. Below the floor of the burning house there is a tank, through which a stream of cold water is constantly flowing. In this a round tripod is placed, on the top of which is laid a round iron plate, with a bole in the centre, about two inches in diameter. On the top of this is placed the bollos of silver, as high as the bell will admit, there being a space of about an inch left between the silver and the side of the bell. This is now lowered on to the top of the silver, the joints at the bottom being well secured. There is next put round the bell (leaving a space of about six or eight inches) mud bricks or adobes; the intermediate space being filled.with charcoal. This is now ignited, and as the heat increases the mercury begins to pass off intóa receptacle below. The fire is kept up for about 12 or 15 hours, when the whole is allowed to cool, and the bell removed. The silver is then found to have a beautiful honeycomb appearance, and is called plati pina. In this state it is removed in leather bags to the government melting and assay office to be run into bare.
It may be worthy of remark that silver produced by the patio amalgamation is purer than that produced by any other method. I have often seen it produced in Guanaxuato as fine as that specially prepared in London for check silver.
The duration of the amalgamation process is very various, and depends on many circumstances. About 25 days may be taken as the average time to work a torta.
Loss of Mercury. -There are two sources of loss of mercury in this operation. One is called the consumido, or the portion required to reduce the silver to the metallic state; in practice, weight for weight is allowed, the correct proportion being as 100 is to 108 . Every thing lont boyond this is called "perdida" It may be taken as a general rule that from 10 to 16 ounces of mercury are sacrificed for each mark (8 ounces) of silrer obtained.

## MINING AND SCIENTIFIC PRESS.

## SAN FRANCISCO MINING NOTICES.

## ASSFESMENTA J.evied.

Assessments upon Mining Stocks have been levied as follows :-
Garabaldi-Assessment of \$1 per share, levied March 2nd.
Sutrn-Assessment of \$1 per share, levied Feb. 23, payable March 23.

Silver Quartz Mill Co.-Assessment of 5 per cent. levied Feb. 23, payabte March 28.

Helvetia.-Assessment of 25 cts. per share, levied Feb. 17, payable March 10.
7ouave.-Assessment of $\$ 1$ levied Feb. 22, payable Mar. 20.

Rogera.-Assessmeat of \$5 per share levied Feb. 4, pay able Mar. 15.
Sam Wright-Assesment of 50 cts . per share levied Mar2, payahle immediately, delinquen sto lie sold A pr. 2.
Napoleon (cupper.) - Assessments of $\$ 3$ per share levied Mar. 3. payable in 30 days.
Gulden Are-Assessiment
Fel, 24, payable Mareh 26.
Washoe Gold \& Silver.-An assessment of 2 per cent. on capital stock was levied Feb. 16, payable Apr. 1.

Rhodes' Diggngs, - Assessment of 25 cts. per share levied F'eb. 26, payable Mar. 5.

Texas Co., at a Meeting held Feb. 14, levied an assessment of one dollar per share, payable to the Secretary in Virginia City.
Santa Rosa Co.-February as:essment of 20 cents per share now due and payable.
Madison Co-An assez:ment, two dollars per share, was levied Feb. 17, payable immediately, at Office, 600 Mer . chant St.
Union Co.-An assessment of one dollar per share was levied February 16, payable on or before March 25.
Pena Co.-An assessment of $\$ 3$ per share was levied Feb. 5, one half payable March 1, balance April 15.
Kossuth Oo., Devil's Gate District.-An assessment of 10 cts. per share was levied Feb. 7.

Constitution Company levied an assessment of 25 cts. per Feb. 11, payable immediately.
La Pla'a Oro Co. levied an assessment of five dollars per share, Feb. 9, payable at Office of the Secretary in Virginia City.
La Plata Co. levied an assesment of 50 cts. per share Feb. 2nd, payable at Office of the President.

Alamo Co. levied an assessment of 50 cts . per share, Feb. 11, payable on or before March 20 , at 115 Cal. Street San Francisco, or at office in Carson City.
Tucker Co. levied an assessment of 25 ets. per share, Feb. 11, payable immediately at 608 Merchant St.

Hawley Co. levied an assessment of one dollar per share, on Feb. 9, payable on or before March 12, to Superinteadent at the mine, or Secretary at Office.
Slate Range Co. levied an assessment of 50 cts . per share, Feb. 4, payable, March 15.
Moss G. \& S. M. Co.-An assessment of 50 cents per share was levied Jan. 27, payable at 428, Montgomery St., or to the Superintendent at the mine.
White Cloud G. \& S. M. Co. levied an assessment of 75 cents per share, Jan. 27, payable to the Secretary, at 428, Montgomery $\mathbf{~ z t}$.
El Dorado G. \& S. M. Oo.-An assessment of One Dollar per share was levied Jan. 23, payable to the Sec. or to the Supt.
Gaudaloupe S. M. Co.-An assessment af $\$ 30$ per share was levied, payable on or before March lst.

El Tesora Mining Co.-An assessment of $\$ 11 / 2$ was levied Jan. 27, payable at office on or befora Feb. 27.
Polar Star G. \& S. M. Co. levied an assessment of 50 cents per share, February 4th, payable on or before the 4th of March, at the Uffice in this city or to the Superintendent at the mine in Aurora, (Esmeralda.)
Dios Padre G. \& S. M. Co. levied an assessment of 3 dollars per share, Jan. 31, payable in 30 days, alsu an assessmont of 2 dollars per share, payable in 60 days, at office 502 Montgomery street.

Beckwith G. \& S. Mining Co.-An assessment of 25 cents per share was levied Jan. 24, payable immediately.
Sonora Mining Co-An assessment of 25 cents per share was levied,Jan 23, payable imnediately.
Overman Mining Co.- 25 eents per foot, Jan. 29, payable within ten days.
Chs. Caney Miving Co.- 50 cents per share, Jan: 21, payable on or before Feb. 20th.

Sirras. M. C'u. An Assessment of² 1 was levied Jun. 22-payable immediately, at Uffice 555 Itission St.
Mount Thvid on Co.-An Assessment of iff cents per ilare was levied. Jan. 23, pmyable on or before March Ist, at Ofice 47 Montgomery Bluck.
Acirntic.-Fifty cents per =hare, p Fable at No. 4 Armory Itall, Sian Franciscu, or to the Superintendent at the Mine. IIattio G. \& S. M. Co.-Thirty cents per share, levied Jan. 31, payable at Office in San Franciseo, or at the Mine. Hale \& Norcso-s-Assessment of Ten Dollars per Ghare. levied Jan. 31 - payable at the Office in this city, or to Juhnsikn, at the Mine. on or before Feb. 25.
Mina l'rieta S. M. Co.-An Assessment of Five Dollars per, 'hare was levied. Jan. 31, payable on or b fore March 3th-at Office, cor. Montgomery \& Jackson Sits.
Recorder Mining ('o.-An Assessment of One Dollar per fuot was levied Jan. 19, payable half on or betore Feb. 18 and batance on or before March 20.

Hale \& Norcross S. M. C'o have levied an assessment of 8.5 per shave payable on or befure Jan. 2 (ith.
Martin White.-An assesement of 20 cls. a share was levied, Jan. 2.
Oriental G. \& S. M. Co.- $\Delta \mathrm{n}$ assessment of 50 cts per share was levied. Jan. 14. payable at Office, cor. Sutton Avenue and C St., Virginia City.
Baltimore America Consolidated.-An assessment of 50 conts per share was levied, Jan. 5.
Savage.-An assessment of $\$ 35$ cents per share was leved. Jan. 7.
Hawley.-An assessment of $\$ 1,00$ per share was levied Feb. 9, payable March 12.
Cole S. M. Co.-An assessment of One Dollar per share was levied, Jun. 10, payable, Feb. 1.
United States M. Co.-An assessment of six and twothirds cts. per share was levied Jan. 10, 1863, payable to the Superintendeat at the mine, or to the Secretary, Rooms 7 and 8, Goverument House, San Francisco.
Sierra Nevada S. M. Co. levied an assessment of $\$ 15$ per share, Jan. 15-payable Feb. 18.
Lady Bryan.-An assessment of 70 cts. was levied, Jan. 13, payable on or before Feb. 16.
Ida G. \& S. Co. (Russ District)-Au assessment of $\$ 1$ was levied, Jan. I4.

## Company meetings.

Chs. Caney Co--Special meeting of stnckholders will be held on Wednesday, March 18, to consiaer the propriety of an increase of capital stock.
South Utah Co. will hold its annual meeting for election of Trustees, etc., at No. 608 Merchant St., March 20.
Nerada Co. will hold its annual meeting for electing Trustees, etc., at 608 Merchant St., March 20.
Annie Laurie Co. will hold its annual meeting for election of 'I'rustees, etc., March 19.

## ASSESSMENT SALES.

Sales of Stock for non-payment of assessments are advertised to bo sold as follows :-
Oriental Tunvel Co. will sell, on Saturday, Mar. 28.
Mars will institate proceedings against delinquents, Mar. 16 th.
Planet will institute proceedings against delinquents Mar. 16 th .
Meredith.-Anaual meeting of stockholders will be held Monday, Mar. 16, at 2 f. ar., at 712 Montgomery St.
Texas Co. will sell delinquent shares, on the 14 of March.
Meredith Co. will sell delinquent stock, March 2n.
Coso Co. will sell delinquent stock, March 18.
Moray Co. (V. City.-Suits for delinquent assessments will be commenced, March 14.
Michigao Co. (Gold Hill) will commence suits for delinquent assessments, March 16.
North Potoci Mining Co.-Sales deliquent stock will be made March 17.
Peytona G. \& S. Mining Co.-Sales of delinquent stock will be rade March 1st.
Cole Silver Mining Co.-Sales by Jerome Rice \& Oo., 327, Modtgomery St., San Franciścó, on the 25th of February.
Combination G. \& S. Mining Co.-Sale by E. S. Spear
Co., at 433 Galifornia St., on the l0th day of March next.
Lady Bryan G. \& S. M. Oo.--Shares of delinquent stockholders will be sold at auction for assessments, at No. 400 , Montgomery steet, on Jan. 27.

Desert Mining Co.-Shares of Jelinquent stocklinhler will be suhl at auction, for asecesbrants, at No. 400, Mont gomery street, Jan. 2\%.

## general. notiers.

Fellow Sacket.-Corpornte Deed $\mathrm{n} \cdot \mathrm{w}$ ready for signature at office of H. G. Maynard, Guld Hill, N. T.
Jenny Lind (Fsmeralda.)--Owners of ground in this Cot are requestes to call and sign deed of trust ut 608 Mercbans st.

Mount Hope Co.-Persons claiming stock are req̧rested to present title papers for examination till March 16.
U. S. Mining Co.-All pirsons claining stock are requested to present title papers for examination at Nos. 7 \& 8 Government House.
Caution.-D. M. Tyrell warns persons against purchasing a certain 10 feet of ground in the Wellinpton Co., standing in the name of J. B. Magec-also 20 feet, standing in name of W. Williams. (See Territorial linterprise.)
Ashland Co.-I. A. Gould, in the name of the Moss Co. notifies the Ashland Co. that their westerly drift has cut the Lamb ledge, in the Muss C'u.'s ground, from which the Ashlaid Co. is forbidden to extract any valuable metals.
Coso Silver Mining Co.-The Office of this Company has been removed from the Stevenson House to Nos. 11 and 13 Court Block, No. 636 Clay street between Montgomery and Kearny. Entrance on both Clay and Merchant streets.
Tue Sweezy Co., Gold Hill, give notice that Baltic Company have wrougfuly claimed and worked their ground since July, 1860.
The Chimney Rock Co., lying next west of the Virginia Co, claims have notified the Hazel Green, Tingley and Btach \& Paxton Companys that they are tresspassing upon the Chimney Rock Co's ground.

## MINING AND SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICL ANO SCIENTIFIC PAPER ON THIS CONTINENT.
THITR TEAR: VOLUME VI. $\rightarrow$ NEW SERIGS!
A uew polume of this extensively circulated paper commenced Sept. It,
1869. It is intended that erery number shall be replete with information 1862. It is intended that every number shall be replete with information
concerbing Miniug, scientific, Mechanical and Industrial pursuits, together
 for its columns.
This paper is devoted to the above purposes, together with the interests
of Science, Arts, Agriculture and Commerce, and any of Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader : and it is the intention of tho proprie-
tor to spare no pains or expense in making it equal in interest and valuabio tor to spare no pains or expense in makin
information to any paper yet published.

## The Mining Interest

Will find it of great value, as it will contain all the news appertaining to Mining, the prices rund sales of Mining Stocks, new inventions of Machinery adapted to that purpose, and of every thang generally that may be of sorvice
to the Miner. to the Miner.

## The Inventor 1

Will find it an excellent medsum for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and also of receiving any ioformation that may be necessary
in obtaining his patent, the proprietor having had great experience as a in obtaining his patent, the prepretor having had great experience as a Patent Agent, together with
ain Patents with cispatch.

## The Mechanic and Manufacturer !

Will be greatly benefitted by its perusal, as each uumber will contan sera eral original engravings of new manchines and inventions, together with y
large amount of reading matter appertaining thereto. We are constantle eral origimal engrangs matter appertaining thereto. We are constantle
large amount of reding mife
receiving the best scjentific journals from all quarters, frous which wr receiving the best scientific journals from all quarters, froms which wr
Elaall continue to extrnut whatovol may be of bunofit or intorest to ousliall cob
readers.

## To Chemists, Architects, Millurights and Farmers !

This journal will be invalunble. All new discoveries in Chemistry will be givel, and a large amount of information of great service to Architects and
Willwrights will be found in our columns. The Farmers and Planters will Millwrights will be found in our columns. The Farmers and Planters will
not be neglectod, engravings will be given of agricultural implements, and the farming interest generally will be amply discussed.
To mall subscribere.
To mall subscribers:-Four Dollars per annum.
Club Rates.
Flve Copies for Six Months, $\$ 8$.
Ten Coppies for Twelve Mon ths, $\$ 30$.
Fifteen Copies for Twelve Months, $\$ 44$.
Twenty Copies for Twelve Months, $\$ 56$.
For all clubs of Twenty and over, the yearly subscription is only $\$ 280$
Names can be sent in at diferent times and from diffrent Names can be sent in at different times and trom diffrent Post-offices
Specimen copies will be sent gratis to any part of the country. Specimen copies will be sent gratis to any part of thp country.

A CHAPTER TO MNVENTORS AND DISCOVERERS.
The whole community is bonefited by the p ro motion of tho useful arts, and, therefore, it is for the public good to bold out the promise of rewards to the inventors of new and useful arts and manufactures, who may first pat the public in possession of them. It is true that by suclu a grant as a patont makes-a monopuly for a time-every other person is restrained during the continuance of the monopoly from using the invention, evell if he makes a similar discovery himself. But at the time the grant is made, it is by no moans certain that the invention will be given to the public, or even made by any other person; and by the temporary suspension of their right, the people acquire the certainty of beng able to use the invention at the expiration of the monopoly. Utility to the publie is, in fact, the consideration of every grant for the sole use of an invention, and letters-patent containing such grants always state tho public good to be the motive in making the grant.
Hence, therefore, the total absence of utility to the public, in any invention, will at all times vitiate a grant of the sole use of it. But it will not be void on that ground if it were useful to the pub lic, although such utility may be very small.
But an invention may be of some uso to the publie, and yet be so trifling or frivolous, that the inconvenience arising from a grant of the sole use of it would not be adequately compensated by the benefit which the public would receive from it. The law, therefore, has deemed it right that mere discovery of any new manufacture shall not vest the sole right to use it in the inventor; but that to be entitled to such privilege he must obtain a grant from the Goveroment, who have the right of judging, not only whether the invention is likely to be of sufficient atility to warrant its being made a matter of public concerv, but also the duration of the privilege it merits.
There is reason to believe, though it is not positively known, that the practice of making grants of the sole use of inventions originated in England, and that it has thence beon copied more or less closely by other nations. It is a power derived from the common law of England; and this law has been modified by statute in modern times $b$. th in England and other countries. (Hindmarch on Patents, 3.)
No person can be the grantee of a privilege in an invention except the true and first inventor. To be capable of supporting such a grant tho patentee must be the person who has not only actually invented or imported the invention, but who has been the first to give it to the public.
In England it is held that the first importer of an invention from abroad may have a patent. (Edgeberry 7s. Stephen, 2 Salk., 447; Dav. P. C. 36.) This, however, is not the case in the United States. Here the inventor alone can get a patent. He is deemed the first inventor who first gives, or contracts by patent to give, a knowledge of it to the public. And the faet of first introducing an ixvention is prima facie proof of first invention. Altbough a patentee's claim to be the first inventor will not be defeated by the prior discovery of the same thing by one who kept it secret, yet it is otherwise if the invention was known to be used by the public at any time before the date of the patent.
If the inventor himself publishes a knowledge of it, the law deems that he thereby dedicates it to the public; and when once the publication has been made the act is irrovocable, and a patent can-
not be granted, or if granted will be useless. And if the public becomes possessed of a knowledge of it by any means whatever, no patent can be granted.

## WORKING SILVER ORES.
